**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

A reconstruction of  
Kulik's table of multiplication  
(1851)

Denis Roegel

2011

(last version: 6 november 2013)

# 1 Jakob Philipp Kulik (1793–1863)

Jakob Philipp Kulik was born in 1793 in Lemberg (now Lviv in Ukraine) which was then part of the Austrian Empire. He first studied philosophy, then law, and finally mathematics. In 1814, he applied for a position of professor of elementary mathematics in Olomouc and in 1816, he became professor of physics at the Lyceum in Graz. In 1822, he was given the title of doctor for a thesis on the rainbow. Four years later, in 1826, he became professor of mathematics at the University of Prague, where he remained till his death in 1863. He is buried in the Vyšehrad Cemetery.

Kulik devoted a large part of his work to the construction of mathematical tables, so that when Kulik died, the mathematician Studnička wrote of him: *Er hat aufgehört zu rechnen und zu leben.*<sup>1</sup> [53, p. 310]

In 1824, Kulik published his *Handbuch mathematischer Tafeln*, a collection of mathematical tables [28]. He computed other tables, sometimes only publishing them many years later. This was the case for his table of squares and cubes which was computed in 1828, but only published in 1848.

His first collection of tables already contained tables of primes and factors, but he devoted his next book published in 1825 entirely to this topic [27]. A second part of the *Handbuch* with the title *Vollständige Sammlung mathematisch-physikalischer Tafeln* was announced, but it was apparently never published.

Other tables followed, in particular conversion tables in 1833 [30], tables of squares and cubes in 1848 [32], tables of hyperbolic sectors and elliptic arcs [34] and a table of multiplication which is described here [33], both in 1851. Kulik also published a calculus textbook in 1831 [29], with a second edition in two volumes in 1843 and 1844, a textbook on mechanics in 1846 [31] as well as perpetual calendars.

But Kulik's most important achievement in tablemaking was his table of factors for all integers up to 100 millions.

## 2 The method of quarter-squares

Kulik's table of multiplication was based on the method of quarter-squares. This method makes use of the identity

$$ab = \frac{1}{4} ((a+b)^2 - (a-b)^2).$$

If we possess a table of squares, and wish to compute the product  $ab$ , it is then sufficient to compute  $a+b$ ,  $a-b$ , to look up the table for these two values, to subtract the values read in the table, and to divide the result by 4. This seems complex, but for large numbers it is more efficient than to compute directly the product.<sup>2</sup>

There have been a number of tables of squares around, in particular those of Ludolf published in 1690 [42], and those published by Séguin in 1801 and giving the squares up to 10000. But these authors did mostly not have multiplications in mind, although Ludolf showed how squares could be used to compute a multiplication. At the beginning

---

<sup>1</sup>“He stopped calculating and living.”

<sup>2</sup>For a survey of the quarter-square method, see the articles by McFarland [44, 43] and Weiss [75].

of the 19th century, the method of quarter squares was mentioned in passing by Laplace in 1809 [10, p. 261] and Gergonne in 1816 [15, pp. 159–160], but they did not produce tables.

It seems that it was only with the publication of the tables of Voisin [74] and Bürger [5] in 1817 that a table of squares was considered useful for the computations of multiplications. But both authors independently went one step beyond, and removed the need to divide by 4. They merely gave a table of quarter-squares for numbers up to 20000.

When a number is odd, its quarter square is of the form  $n + 0.25$  and Voisin and Bürger only gave the value  $n$ . So if  $a$  and  $b$  are both odd or both even, the values of the quarter-squares are given exactly. If one of the integers is odd and the other is even, both quarter-squares are in default by 0.25, but the difference of these two values is correct. So, Voisin and Bürger's tables are not totally accurate for a table of squares, but they serve the purpose of a table of multiplication. If one wished to use them as a table of squares, one would need to remember to add 1 to the result multiplied by 4, whenever the value entered is odd.

A table of quarter-squares is also very advantageous with respect to space. Such a table is a linear table, with only one entry. With slightly more work than a mere table of multiplication, it is possible with a table of quarter-squares to do computations that would require many thousands of pages with a conventional table of multiplication, such as Crelle's table [8].

A number of other tables of quarter-squares were published during the 19th century (table 1), in particular in 1825 by Centnerschwer [6], in 1832 by Merpaut [45], in 1851 by Kulik (described here), in 1856 by Laundy [39], and in 1887 by Blater [3]. In 1836, Galbraith published a small table of quarter-squares in a more general collection of tables [14]. This table was probably borrowed from Voisin's table.

In the preface of his table of quarter-squares [39, p. iv], Laundy also mentions that Peter Gray had in his possession a manuscript of a table of quarter-squares extending to 200000 by Shortrede, but that table was never published.

There have also been several applications of quarter-squares for mechanical aids. In 1829, Schiereck invented a calculating machine based on quarter-squares [76] and in 1841 he devised an instrument for the measurement of the area of triangles, useful in surveying, and also based on quarter-squares [71, 23].

In a book published in 1857, Edward Sang also suggested the use of quarter-squares for multiplications [7, pp. 50–51]. The use of quarter-squares declined in the first half of the 20th century [44], but Bojko in 1909 [4] and Plassmann in 1933 [52] each published tables of quarter-squares up to 20000.

In the 1950s, however, new applications of the quarter-squares method for multiplication on analog devices surfaced, and this prompted their use for the implementation of multiplication in digital processors [24, 25].

Finally, we mention that tables of triangular numbers can also be used in a way similar to quarter-squares in order to facilitate the multiplications [9].

| Table                | Range  | Pages | Density |
|----------------------|--------|-------|---------|
| Voisin (1817)        | 20000  | 123   | 162.6   |
| Bürger (1817)        | 20000  | 80    | 250.0   |
| Centnerschwer (1825) | 20000  | 40    | 500.0   |
| Merpaut (1832)       | 40000  | 400   | 100.0   |
| Kulik (1851)         | 30000  | 40    | 750.0   |
| Laundy (1856)        | 100000 | 200   | 500.0   |
| Blater (1887)        | 200000 | 200   | 1000.0  |
| Bojko (1909)         | 20000  | 20    | 1000.0  |
| Plassmann (1933)     | 20009  | 200   | 100.0   |

Table 1: A comparison of the main tables of quarter-squares. The density is the ratio of the range by the number of pages. The tables which pack the greatest ranges in the smallest number of pages are those of Blater and Bojko.

### 3 Kulik’s table of 1833

Kulik’s first table of quarter-squares was published in 1833, as part of a collection of tables facilitating the conversion of various units [30]. Kulik called his collection “Toasir”-tables, although the meaning of “Toasir” is not totally clear. It may have the meaning of “conversion.”

Most of Kulik’s tables were specialized tables, but one of the tables was more general and was not meant for conversions between various units. The table published in 1833 only gave the quarter-squares up to 20000, and its layout suffered a number of anomalies.

In the introduction of the tables, Kulik claimed to have discovered the new principle underlying his tables, namely the quarter-squares, and he was unaware that Voisin [74] and Bürger [5] had already discovered their usefulness and given the quarter-squares for the same range as Kulik.<sup>3</sup>

### 4 Kulik’s table of 1851

The 1851 tables of quarter-squares [33] are actually extensions of the 1833 tables. The new tables give the quarter-squares up to 30000, and their layout is much more regular, although not very different from that of the tables published in 1833.

Kulik’s tables are actually in three parts.<sup>4</sup> The first part gives the explicit products of 2-digit numbers in a very straightforward way.

The second part gives the (integer part of the) quarter-squares of all integers from 0 to 29999 and can therefore be used for computing the products of two integers whose sum

---

<sup>3</sup>On the other hand, Voisin’s table is nowadays extremely rare, and it is understandable that Kulik did not know about it. In 1873, Glaisher wrote that he had not seen it, but that there was supposedly a copy in the Graves library [16, p. 23]. Eventually, Glaisher gave a more detailed description of Voisin’s table in 1889 [18], and we assume that he then had seen it.

<sup>4</sup>In the first version of this reconstruction, only the second part of the tables had been reconstructed, because we had not seen all of the original table.

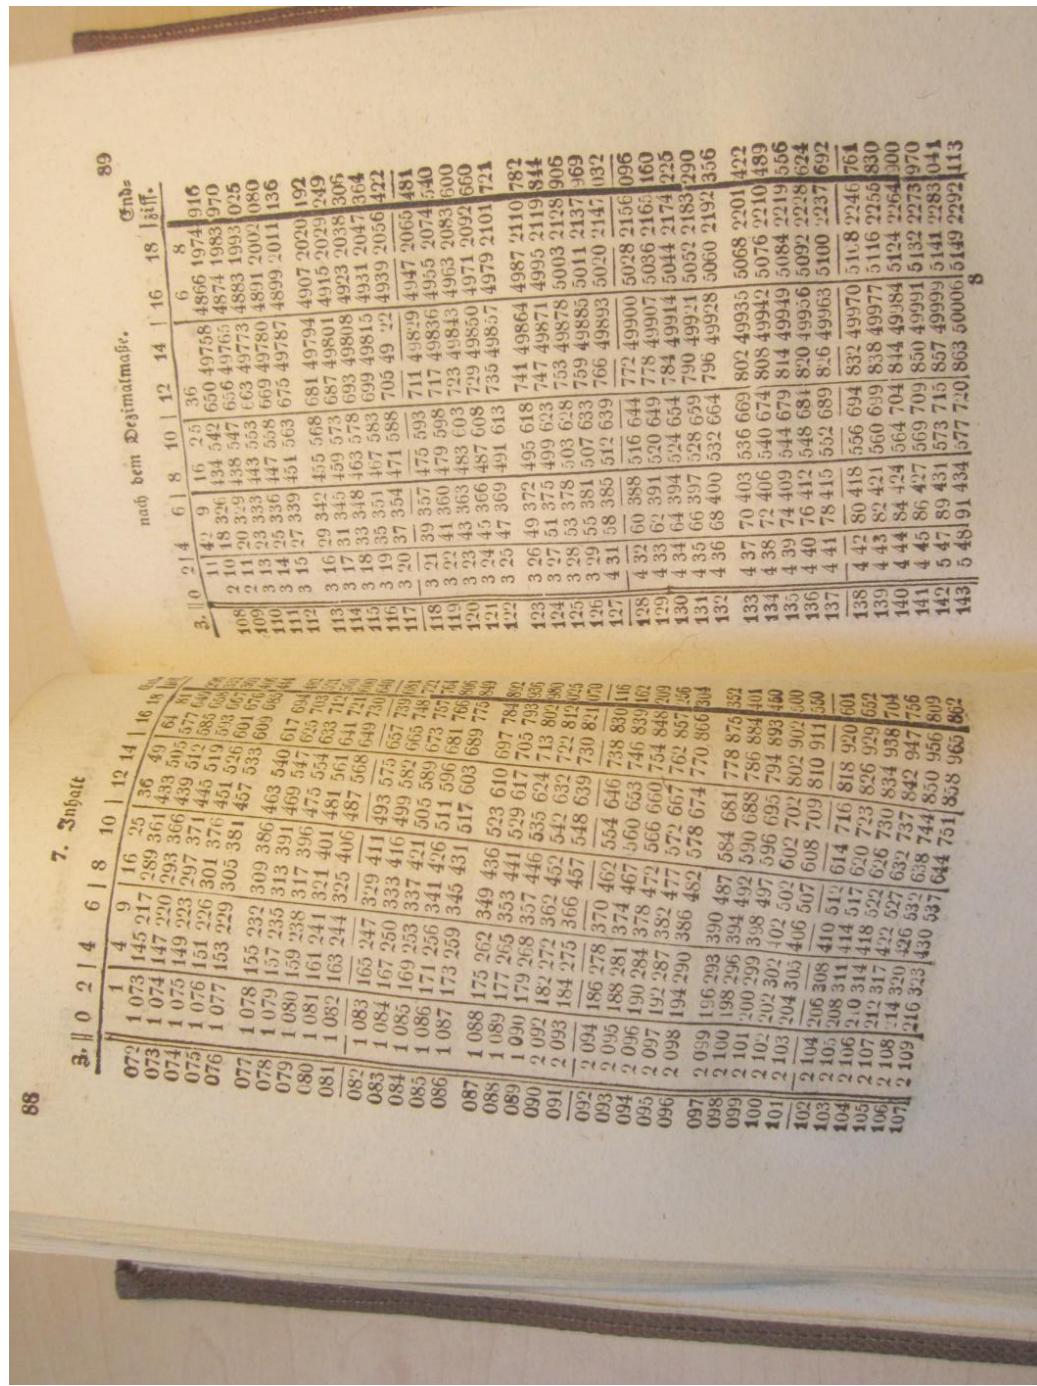

Figure 1: Excerpt of the 1833 tables [30]. (courtesy of the library of the observatory, Vienna)

does not exceed 29999. Kulik's table is a double-entry table and a number  $n$  is written  $a \times 1000 + b$ . The value of  $b$  ranges from 000 to 999 and appears in the column on the left of each page. The value of  $a$  ranges from 0 to 29. The even values of  $a$  appear on even pages, and the odd values on odd pages. This is not merely a fancy organization, but it is required by the way in which the result is indicated. The last three digits of the quarter squares are given separately, and they are common for a whole line, but not (or not always) on two identical lines of consecutive pages. Indeed,

$$\frac{(a \times 1000 + b)^2}{4} \bmod 1000 = \frac{((a + 2c) \times 1000 + b)^2}{4} \bmod 1000 \quad (1)$$

So, if we call  $q(x)$  the (integer part of the) quarter-square function, we have  $q(1703) = \dots 052$ ,  $q(3703) = \dots 052$ ,  $q(5703) = \dots 052$ , ..., but  $q(2703) = \dots 552$ ,  $q(4703) = \dots 552$ ,  $q(6703) = \dots 552$ , ...

In general, the value of  $q(x)$  is separated in three parts  $\alpha\beta\gamma$ , each of  $\beta$  and  $\gamma$  made of three digits. The last part,  $\gamma$  (called "M" by Kulik), is given in the column at the right on the line corresponding to  $x$ . So, in the previous examples,  $q(1703)$  has its last three digits 052 on the line 703. The middle part,  $\beta$ , is given at the intersection of the column for  $a$  and the line for  $b$ . In the table, we find  $\beta = 25$ . One should however be careful, because the leading digits are not always given and may need to be searched a few lines above. For  $q(3703)$ , for instance, we find 28 at the intersection of  $a = 3$  and  $b = 703$ , but this column contains three-digit integers and the actual value of  $\beta$  is 428. Finally,  $\alpha$  is given above the first line for  $b$ , and in this case, for  $q(1703)$ , it is 7. So, we have found  $\alpha = 7$ ,  $\beta = 25$ , and  $\gamma = 052$ , and the result is  $q(1703) = 725052$ . Indeed,  $\frac{1703^2}{4} = 725052.25$ .

In some cases, the value found at the intersection of the column for  $a$  and the line for  $b$  contains a "\*" or there is a "\*" in front of a previous value in that column. In that case, the value found for  $\alpha$  should be increased by one unit. For instance, if we wish to compute  $q(22730)$ , we first find 128163225, but in fact the correct result is 129163225.

Now, Kulik's table can be used to compute a product. If we want to compute  $2817 \times 16381$ , we first compute the sum and the difference of these two integers, we compute their quarter-squares, and we take the difference:

$$x = 16381 + 2817 = 19198 \quad (2)$$

$$y = 16381 - 2817 = 13564 \quad (3)$$

$$q(19198) = 92140801 \quad (4)$$

$$q(13564) = 45995524 \quad (5)$$

$$92140801 - 45995524 = 46145277 \quad (6)$$

and we can indeed check that  $2817 \times 16381 = 46145277$ .

Kulik's table of quarter-squares was an inspiration for Blater's table [3], but Blater swaped the columns and lines of Kulik's table and extended the table to 200000. Blater also writes that during the construction of his table, he found 30 errors in Kulik's table, because Kulik's values appear twice in Blater's table. Unfortunately, Blater doesn't give the list of those errors.

Finally, Kulik gives a third one-page table of the first hundred multiples of  $\pi$  and  $\pi^{-1}$  to 12 places, which has not been reproduced here.

## 5 Reconstruction

Our first reconstruction in 2011 was based on the 2-page excerpt given by Porubský [53]. Most of the second table could be reconstructed, but there were still some uncertainties for certain pages, and the first table was not reconstructed. In 2013, we were able to get hold of an entire copy of the tables through Andrea Celli, leading to a more faithful reconstruction, in particular in the positioning of the “\*” marks. One should however notice that there are some inconsistencies in Kulik’s second table. The values of  $\beta$  are not always given with three digits, and consequently the values of  $\alpha$  do not always correspond to digits of the same weight. This problem only occurs in some of the first columns of the pages. For instance, in the first column of page 19, we have  $\alpha = 0$ , and the first value of  $\beta$  is 275. Therefore, the quarter-square of 1050 is 0|275|625. But on page 17, we have  $\alpha = 2$ , and the first value of  $\beta$  is 50, so that the quarter-square of 1000 is 2|50|000. On page 33, we have the quarter-square of 1400 given as 0|490|000 and on page 35 the quarter-square of 1450 given as 5|25|625. In our reconstruction, we have always taken  $\beta$  to be on three digits, as did Kulik in all his table, except in a few cases of the first columns.

---

<sup>5</sup>**Note on the titles of the works:** Original titles come with many idiosyncrasies and features (line splitting, size, fonts, etc.) which can often not be reproduced in a list of references. It has therefore seemed pointless to capitalize works according to conventions which not only have no relation with the original work, but also do not restore the title entirely. In the following list of references, most title words (except in German) will therefore be left uncapitalized. The names of the authors have also been homogenized and initials expanded, as much as possible.

The reader should keep in mind that this list is not meant as a facsimile of the original works. The original style information could no doubt have been added as a note, but we have not done it here.

## **Zweite Tafel.**

Produkte drei-, vier- und fünfziffriger Faktoren,  
deren Summe die Zahl 30000 nicht übersteigt.

Kulik's table of multiplication (1851) (reconstruction, D. Roegel, 2011–2013)

| N.  | 0 | 2   | 4   | 6   | 8   | 10  | 12  | 14  | 16  | 18  | 20  | 22  | 24  | 26  | 28  | M.  |
