HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

A reconstruction of
Lambert's table of factors
(1770)

Denis Roegel

9 October 2011

1 Lambert

Johann Heinrich Lambert (1728–1777) was born in Mulhouse, then in Switzerland, and now in France. He became bookkeeper, and in 1745 secretary to a newspaper editor in Basel. He was recommended as a private tutor to the family of Count von Salis, and this gave him access to a good library. In 1759, he resigned his tutorship. In 1760, Euler recommended him for a position of professor of astronomy at the St Petersburg Academy of Sciences. In 1764, he was invited by Euler for a position at the Royal Academy of Sciences in Berlin. In 1774, he edited the Berlin ephemeris. He died in 1777.

Lambert wrote on many different topics. He was very early interested in geometry and astronomy and he tried to compute the orbit of the great 1744 comet. His first book was published in 1758 and was on the passage of light through various media. He proved the irrationality of π in 1761 and introduced hyperbolic functions in trigonometry. He published a book on non-euclidian geometry in 1766. He worked on the properties of map projections and in 1772 published seven new projections. He also wrote on heat, magnetism, comets, probability, etc. Lambert was recognized as among the first mathematicians of his day. He was also the author of logical and philosophical memoirs.

Figure 1: Johann Heinrich Lambert (1728–1777)

2 Lambert's table to 10200 (1770)

In the second part of his *Beyträge zum Gebrauche der Mathematik und deren Anwendung* published in 1770 [31], Lambert explained the construction of a table of factors, and gave a table for those integers from 1 to 10199 which are not divisible by 2, 3, or 5 (figures 2 and 3). He excluded these numbers because their divisibility is easy to see, and because it shortens the tables. For practical reasons, the interval of 300 integers was taken as a base.

Lambert seems to have based his table on that of Poetius [36], as he writes that he extended Poetius' table from 10000 to 10200 and found several errors in Poetius' table [31, p. 53].¹ Poetius gave the decompositions into simple factors of all numbers from 1 to 1000, and of all numbers not divisible by 2, 3, or 5 from 1001 to 9997. Lambert was also influenced by the work of Anjema [1], that he wished to simplify. Lambert remarked that tables of factors had been neglected, and that several similar tables had been computed independently. Lambert therefore wished to publicize his work on a wider scale, so that this research could move on. He wrote that someone could now compute nine similar tables (up to 102000), or even 99 similar ones (up to 1 020 000) [31, p. 49].

Lambert's table fit on one foldout and gave all simple factors, arranged in columns corresponding to intervals of 300 integers, but these columns were all split in three parts, and each part was grouped with the hundreds differing by a multiple of 300. This table obviously influenced Vega for his table of primes and factors published in 1782 [54].

Tafel der Primzahl und der Faktoren von denen Zahlen die unter 10200, und durch 2, 3, 5 nicht theilbar sind.

Figure 2: Lambert's first table to 10200 (1770) [31].

Figure 3: Excerpt of Lambert's first table to 10200 (1770) [31].

3 Lambert's table to 102000 (1770)

In his *Zusätze zu den Logarithmischen und Trigonometrischen Tabellen etc.* [32] and published the same year as the *Beyträge*, Lambert included a table giving the smallest factor of all numbers not divisible by 2, 3 or 5 from 1 to 102000. Although the range of the table was almost the same as that of Brancker's table [38], Lambert's extension does not seem to have been based on Brancker's table, at least not directly. Lambert may have used the method he used to complete Poetius' table from 10000 to 10200.

This extended table differs from Lambert's first table, in that he no longer gives all simple factors. Lambert also split the intervals of 300 in three different areas on two consecutive pages, and the total range of the table corresponds to 34 double pages, each double page covering an interval of 3000 values.

More exactly, the pages of Lambert's table are numbered from 2 to 69. Page $p = 2k$ gives the smallest factors of the numbers $3000(k-1)+1$ to $3000(k-1)+97$, $3000(k-1)+301$ to $3000(k-1)+397$, $3000(k-1)+601$ to $3000(k-1)+697$, etc., $3000(k-1)+2797$ as well as the first half of the smallest factors of the numbers $3000(k-1)+101$ to $3000(k-1)+197$, $3000(k-1)+401$ to $3000(k-1)+497$, ..., $3000(k-1)+2801$ to $3000(k-1)+2897$.

Page $p = 2k + 1$ then gives the smallest factors of the numbers $3000(k-1)+201$ to $3000(k-1)+297$, $3000(k-1)+501$ to $3000(k-1)+597$, $3000(k-1)+801$ to $3000(k-1)+897$, etc., $3000(k-1)+2997$ as well as the second half of the smallest factors of the numbers $3000(k-1)+101$ to $3000(k-1)+197$, $3000(k-1)+401$ to $3000(k-1)+497$, ..., $3000(k-1)+2801$ to $3000(k-1)+2897$. Prime numbers are

Figure 4: Excerpt of Lambert's extended table (1770) [32].

indicated with a horizontal dash.

The excerpt in figure 4 shows for instance that the smallest factor of 27007 is 113.

An errata to Lambert's table appeared in the preface of the third volume of his *Beyträge zum Gebrauche der Mathematik und deren Anwendung* [33].

4 Extensions of Lambert's table

In his *Zusätze* [32], Lambert wrote that “it would in fact be desirable if we could obtain the factors of a number from 1 to 1000000 and even beyond, merely by opening a table.”² This call was quickly answered by Wolfram, Oberreit, von Stamford, Rosenthal, Felkel, Hindenburg, and perhaps others.

But already before the publication of Lambert's table, Wolfram and Marci had computed tables of factors extending to 300000 or tables of primes extending to 400000 [35]. After Lambert's call, the first to work on the extension of Lambert's table was apparently Ludwig Oberreit, who extended the table to 500000, with a few gaps. This table, however, was never published, because Lambert waited for the completion of other tables, because of the competition between Felkel and Hindenburg, and eventually because of Lambert's death in 1777. The main immediate outcomes of Lambert's call were the publications of Felkel's table [17, 18, 19, 20] and Hindenburg's method in 1776 [27].³

5 The second table of factors (1798)

A new edition of Lambert's table was published by Anton Felkel in Lisbon in 1798, as part of the Latin translation of Lambert's original collection of tables [34]. Although the factor table retains the same general layout and interval, it was extended by indicating more factors, using in particular letters.

6 Influence on later tables

Lambert's table is somewhat irregular and this irregularity is a problem for a mechanical approach such as the use of a sieve. Odd and even pages are not identical, and there are in fact three tables on two pages, one of the tables being split in two parts. Each hundred $100k$ to $100k + 99$ belongs to one of three types, depending on the value of $k \bmod 3$.

This irregular arrangement can be made regular by grouping one column of each of the three tables in one new column, or, in other words, by considering intervals of 300 instead of 100. This is exactly what was done by Burckhardt [11], and continued by Kulik, Crelle, Dase and Glaisher [14, 15, 16, 21, 22, 23, 29].

²*Es wäre in der That erwünscht, wenn wir von 1 bis auf 1000000 und noch weiter die Theiler der Zahlen durch blosses Aufschlagen einer Tafel haben könnten* [32, p. 9].

³For the correspondence with Felkel, and others, see our reconstruction of Felkel's tables [46].

7 Reconstruction

The reconstruction of Lambert's table was straightforward. We have also reconstructed Brancker's table [38] and the second edition of Lambert's table [34], which should make the comparisons easy.

References

The following list covers the most important references⁴ related to Lambert's table. Not all items of this list are mentioned in the text, and the sources which have not been seen are marked so. We have added notes about the contents of the articles in certain cases.

⁴**Note on the titles of the works:** Original titles come with many idiosyncrasies and features (line splitting, size, fonts, etc.) which can often not be reproduced in a list of references. It has therefore seemed pointless to capitalize works according to conventions which not only have no relation with the original work, but also do not restore the title entirely. In the following list of references, most title words (except in German) will therefore be left uncapitalized. The names of the authors have also been homogenized and initials expanded, as much as possible.

The reader should keep in mind that this list is not meant as a facsimile of the original works. The original style information could no doubt have been added as a note, but we have not done it here.

- [35] Adolf Frederik Marci. *Uitvoerige tafelen van de ondeelbaare of prim-getallen van 1 tot 400000*. Amsterdam, 1772. [not seen]
- [36] Johann Michael Poetius. *Gründliche Anleitung zu der unter den Gelehrten jetzt üblichen arithmetischen Wissenschaft etc*. Frankfurt: Johann Ernst Fritschen, 1728.
- [37] Johann Heinrich Rahn. *Teutsche Algebra oder Algebraische Rechenkunst*. Zurich: Johann Jacob Bodmer, 1659. [English extended translation in [38].]
- [38] Johann Heinrich Rahn. *An introduction to algebra*. London, 1668. [Translated from [37] and extended by Thomas Brancker and John Pell. Brancker’s table contained in this volume was reconstructed in [39].] [not seen]

- [39] Denis Roegel. A reconstruction of Brancker’s *Table of incompositis* (1668). Technical report, LORIA, Nancy, 2011. [This is a recalculation of Brancker’s table in [38].]
- [40] Denis Roegel. A reconstruction of Burckhardt’s table of factors (first million, 1817). Technical report, LORIA, Nancy, 2011. [This is a reconstruction of the table in [12].]
- [41] Denis Roegel. A reconstruction of Burckhardt’s table of factors (second million, 1814). Technical report, LORIA, Nancy, 2011. [This is a reconstruction of the table in [9].]
- [42] Denis Roegel. A reconstruction of Burckhardt’s table of factors (third million, 1816). Technical report, LORIA, Nancy, 2011. [This is a reconstruction of the table in [10].]
- [43] Denis Roegel. A reconstruction of Dase’s table of factors (eighth million, 1863). Technical report, LORIA, Nancy, 2011. [This is a reconstruction of the table in [15].]
- [44] Denis Roegel. A reconstruction of Dase’s table of factors (ninth million, 1865). Technical report, LORIA, Nancy, 2011. [This is a reconstruction of the table in [16].]
- [45] Denis Roegel. A reconstruction of Dase’s table of factors (seventh million, 1862). Technical report, LORIA, Nancy, 2011. [This is a reconstruction of the table in [14].]
- [46] Denis Roegel. A reconstruction of Felkel’s tables of primes and factors (1776). Technical report, LORIA, 2011. [This is a reconstruction and an extension of Felkel’s tables [17, 18, 19, 20].]
- [47] Denis Roegel. A reconstruction of Glaisher’s table of factors (fifth million, 1880). Technical report, LORIA, Nancy, 2011. [This is a reconstruction of the table in [22].]
- [48] Denis Roegel. A reconstruction of Glaisher’s table of factors (fourth million, 1879). Technical report, LORIA, Nancy, 2011. [This is a reconstruction of the table in [21].]
- [49] Denis Roegel. A reconstruction of Glaisher’s table of factors (sixth million, 1883). Technical report, LORIA, Nancy, 2011. [This is a reconstruction of the table in [23].]
- [50] Denis Roegel. A reconstruction of Kulik’s “Magnus Canon Divisorum” (ca. 1825–1863): Introduction. Technical report, LORIA, Nancy, 2011. [This is a reconstruction of [29].]
- [51] Denis Roegel. A reconstruction of Lambert and Felkel’s table of factors (1798). Technical report, LORIA, Nancy, 2011. [This is a reconstruction of the table of factors in [34].]
- [52] Denis Roegel. A reconstruction of Vega’s table of primes and factors (1782). Technical report, LORIA, 2011. [This is a reconstruction of the table in [54].]
- [53] Paul Peter Heinrich Seelhoff. Geschichte der Factorentafeln. *Archiv der Mathematik und Physik*, 70:413–426, 1884.
- [54] Georg Vega. *Vorlesungen über die Mathematik*, volume 1. Wien: Johann Thomas Edlen von Trattner, 1782. [The tables of primes and factors are reconstructed in [52].]
