HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

A reconstruction
of Viète's
Canon Mathematicus
(1579)

Denis Roegel

20 December 2011

1 Viète's predecessors

1.1 Rheticus (1514–1574)

Georg Joachim was born in 1514 in Feldkirch (Austria) in what was formerly the Roman province of Raetia, from which the name Rheticus is derived. His father was a doctor.¹ After studying in Zurich from 1528 to 1532, Rheticus went to Wittenberg to complete his education. Wittenberg was then the center of the sciences. He obtained his doctorate in 1536, went to Nuremberg and Tübingen, then was called back to Wittenberg as professor of mathematics in 1536, along with Erasmus Reinhold. In 1539, he went to Frauenburg in order to assist Copernicus and pushed him to publish the details of his theory.

Rheticus resumed his teaching in Wittenberg in 1541 and in 1542, Copernicus' *De lateribus et angulis triangulorum* was published in Wittenberg. This short treatise on trigonometry contains a table of sines for every minute of the quadrant and for a radius of 10^7 . The sines were given to seven places, over 36 pages, with the first half of five consecutive degrees on one page, and the next half on the following page. The table also gave the cosines, although this name did not exist then. It was only introduced by Gunter in 1620 [22]. The sine headings were on the top and left column, and the cosine headings on the bottom and right column. Finally, this table had a column for the differences. This table was certainly published under Rheticus' pressure, but its contents was taken from Regiomontanus' works.

Copernicus' *De Revolutionibus* (1543), whose printing was partly overseen by Rheticus, contained the same chapter on trigonometry, but with a simpler table. The sines were only given every $10'$ and for a radius of 100000. The values were also taken from Regiomontanus' works.

In 1542, Rheticus went to Nuremberg and Philip Melanchton then helped him to obtain a position at Leipzig University where he remained from 1542 to 1551. Rheticus had to leave Leipzig after being accused of homosexual conduct and went to Prague in 1551. He gave up his academic career and completed his medicine studies. He settled in Cracow in 1554 where he practiced medicine. Cracow was located on the same meridian as Frauenburg and Rheticus had a 15-meter obelisk erected near the city for astronomical purposes which were never completed. Rheticus died during a visit in Košice, now in Slovakia, in 1574.

1.2 Rheticus' first table (1551)

Rheticus published his first trigonometrical canon, the *Canon doctrinae triangulorum*, in 1551 in Leipzig [35]. It gave the six trigonometrical functions at intervals of $10'$, semi-quadrantly arranged. Each function was given to 7 places, or more exactly as integers for a radius of 10^7 . This is a very rare table, and it was practically unknown when De Morgan happened to find a copy of it in the 1840s [10, 11].

Rheticus was the first to provide a uniform treatment of the six trigonometric func-

¹For extensive biographies of Rheticus, see Burmeister [7], and Danielson [9].

tions. He was in particular the first to publish a table of secants.² Rheticus only computed two thirds of his table. The table of sines was taken from Regiomontanus [21, p. 152], but the tangents and secants were recomputed from the sines [21, p. 193]. Rheticus had therefore to compute about 1080 ratios ($90 \times 6 \times 2$).

He did not consider angles in circles, but triangles of which one of the side was constant, and he gave the lengths of the other sides as a function of the angle at the center. The name of “sine” was not used by Rheticus, nor those of tangent and secant, the latter two having not yet been introduced.³ The sides were called “base,” “perpendicular,” and “hypothénuse.” The tables span 14 pages, with 7 degrees on each double page. The last double page is not totally filled, with only the degrees 42 to 44. Each double page is split in three groups of two columns. Each group gives the values of two functions and their differences. The first group (hypothénuse = 10^7) gives the sines and cosines, with their differences. The second group (base = 10^7) gives the secants and the tangents. And the third group (perpendicular = 10^7) gives the cosecants and the cotangents. The structure of the table was first described by De Morgan [10, 11].

The 1551 canon has been reprinted in 1565 in Basel [21, p. 185].⁴

1.3 Maurolico (1558)

After Rheticus’ 1551 table, other authors such as Rheinhold in 1554 [34], [21, pp. 152–153], or Fincke in 1583 [16], still continued to give simpler tables based on Regiomontanus’ tables, but some authors were directly influenced by Rheticus. The first of them was Francesco Maurolico.

In 1558, Francesco Maurolico (1494–1575) published his commentary on the spherics of Theodosius [30]. This commentary contained short tables of sines, tangents and secants, probably inspired by Rheticus’ table [53, vol. 1, p. 151], but in part recomputed directly using Regiomontanus’ original tables of sines.

2 Viète’s *Canon mathematicus* (1579)

Also inspired by Rheticus’ table [24], François Viète (1540–1603) constructed a new table, which he called the *Canon mathematicus* [49]. The printing of the table was started in 1571 but it was only completed in 1579 [45, p. 205].

The *Canon mathematicus* contained a typographically sophisticated table of the six trigonometric functions for every minute of the quadrant and with a radius of 100000, with sometimes one or four additional figures (figure 1) [24] [13, pp. 455–456]. This was the first published canon giving the trigonometrical functions every minute, but on the other hand it gave them to less places than Rheticus’ first table. Viète took the sines from Regiomontanus, except for some parts which have been recomputed [21, pp. 154–155]. The tangents and secants were recomputed from Regiomontanus’ values [21, pp. 189, 196].

²In 1819, Delambre, unaware of Rheticus’ 1551 table, still wrote that Viète was the first to put together all these functions in 1579 [13, p. 456].

³It was Thomas Fincke who in 1583 first used the names “tangent” and “secant” [16, 12].

⁴De Morgan wrote earlier that it had been reprinted in 1580 [11, p. 521].

It seems therefore that Viète did not use here the techniques he developed for angular sections, techniques which allow the accurate computation of $\sin 1'$ using quinquisection, trisection and bisection [51].

The first double column gives the sines and cosines. They correspond to the perpendicular and the base of a triangle whose hypotenuse is 100000. The second double column gives the tangent and the secant. They correspond to the perpendicular and the hypotenuse of a triangle whose base is 100000. The third double column gives the cotangent and the cosecant. They correspond to the base and the hypotenuse of a triangle whose perpendicular is 100000.

The values of the cosines and secants up to $2'$ are given with four additional digits. From $3'$ to $24'$, only three additional digits are given, from $25'$ to $4^\circ 5'$ only two, and finally only one. This is explained in a marginal note on the second page of the table.

Viète made a special case of the first value, which is actually not 0 degrees. Viète wanted to avoid infinite values, as alluded in the marginal note on the first page.⁵ In fact, Viète computed with an angle whose sine and tangent was close to 10^{-5} (one unit with an hypotenuse of 100000) and whose cotangent and cosecant was therefore close to 10^5 (10^{10} units with a perpendicular of 100000). An angle satisfying these conditions is $\arctan(10^{-5})$. The arcsin would not have been totally satisfying, as the cotangent then would have been 9999.99999 and not 10^5 . We have $\arctan(10^{-5}) \approx 0'2''3''' \frac{3}{4}$, but Viète's table incorrectly gives it as $0'2''3''' \frac{2}{4}$, although this is probably a typographical error. If Viète had really meant $\frac{2}{4}$, he would certainly have written $\frac{1}{2}$ instead. This angle is not difficult to obtain, as it is given to a good approximation in degrees by $\frac{1}{10^5} \times \frac{180}{\pi}$, even if we only take $\pi \approx 3.14$.

As observed by Tannery, if Viète's tables are rare it is because of the success of Rheticus' *Opus palatinum* (1596), of Pitiscus' *Thesaurus mathematicus* (1613), and because of the introduction of logarithms (1614). They all made Viète's tables obsolete.

A persistent legend is that the *Canon mathematicus* contained many errors, and that Viète consequently withdrew or re-purchased all the copies he could find and had them destroyed. This would then have explained why this book is of great rarity [15] [8, pp. 583–584]. But according to Ritter's biography of Viète [37, p. 54], this legend rests on the editor of Viète's 1646 *Opera* omitting the *Canon mathematicus*, on the grounds that the computations would have to be redone [45, p. 208] [46]. Moreover, our samples (see below) show that Viète's table was quite accurate.

The *Canon mathematicus* was also published with a London imprint in 1589 (*Opera mathematica*, London: Bouvier) and there is an edition dated 1609, but Bosmans showed that it is not a reprint. It is the 1579 edition rebound [6, pp. 111–114] [5, pp. 297–298]. Cantor and von Braunmühl had mistakenly thought that it was a new edition [53] [8, p. 583], probably after Eneström led them to think so [15].

⁵We are indebted to Marisa Addomine for helping us translate the two marginal notes.

Figure 2: An excerpt of the same page from the Gallica digital library. This excerpt is representative of the bad digital quality of most of the books scanned from microfilms at Gallica.

3 Otho's *Opus palatinum* (1596)

After the publication of Rheticus' 1551 canon, Rheticus continued to work on a more extensive project, where the six trigonometric functions would be given every $10''$ and for a radius of 10^{10} . This work was only completed after Rheticus' death by Lucius Valentinus Otho and published in 1596 [36, 41].

4 Reconstruction and analysis of errors

We have reconstructed the first two tables of the *Canon mathematicus*. The second table (*Canonion triangulorum*) is described separately [42].

The main trigonometrical table was recomputed using the GNU `mpfr` multiple-precision floating-point library developed at INRIA [19], and gives the exact values. The comparison of our table and Viète's therefore immediately show where Viète's table contains errors. We have not checked Viète's entire table, but only the values of the trigonometric lines on the first and last pages out of 90. The differences have not been checked. On the first page, there are two typographical errors and 14 last digit errors, out of 186 values. On the last page, there is one typographical error, and 13 last digit errors. Based on these samples, Viète's table may have an average of one or two typographical errors per page, and about a dozen last-digit errors, which were never greater than two units on the first and last pages. These observations counter the allegations according to which Viète's table was full of errors, and could therefore not be printed.

References

The following list covers the most important references⁶ related to Viète’s tables. Not all items of this list are mentioned in the text, and the sources which have not been seen are marked so. We have added notes about the contents of the articles in certain cases.

⁶**Note on the titles of the works:** Original titles come with many idiosyncrasies and features (line splitting, size, fonts, etc.) which can often not be reproduced in a list of references. It has therefore seemed pointless to capitalize works according to conventions which not only have no relation with the original work, but also do not restore the title entirely. In the following list of references, most title words (except in German) will therefore be left uncapitalized. The names of the authors have also been homogenized and initials expanded, as much as possible.

The reader should keep in mind that this list is not meant as a facsimile of the original works. The original style information could no doubt have been added as a note, but we have not done it here.
