Submitted on 30 Oct 2012

HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.
Context and Motivation

- Growth of interest in ICNs
- Large expansion of IoT and WSN

Can CCNx be used as the core protocol in WSN applications?

Challenges

Protocol adaptation

- Develop a fully operational CCN communication stack
- Adjust CCN messages and optimize Interest for reused data collection
- Overcome the IEEE 802.15.4 frame size limit (102 bytes for payload)

Approach

Contiki Operating System: http://www.contiki-os.org/
- The Open Source Operating System for the Internet of Things
- Contiki allows tiny, battery-operated low-power systems communicate with the Internet
- Providing several communication stacks

CCNx Stack in Contiki

- Implements CCN processing functions, message forwarding and data caching
- Manages event posting to processes
- CCN Driver: handles message exchange with the lower layer

- Hierarchical names with components of arbitrary lengths
- Names in URI representation
- Content storage at intermediate nodes

Message Adaptation

- Simplify Interest and Content Object messages

Experiment & Results

Topology

Parameters

- Available content at each node $N_i$: temperature, humidity, battery, light, RSSI, ETX
- 180 seconds between two collection requests to every node
- Interest with prefix /COLLECT/Ni to collect data from node $i$
- Content updated every 70 seconds at each node $N_i$

Delivery Delays
