## Comparing Boolean and piecewise affine differential models for genetic networks

Madalena Chaves, Laurent Tournier, and Jean-Luc Gouzé

### 1 Discrete (multi-level) and Boolean models

The example used in this paper is a piecewise affine (PWA) model of the nutritional stress response in *E. coli* developed by Ropers et al (2006) and analysed from the mathematical point of view by Grogard et al (2007) (the mathematical model is given in the main text).

Following the methods described in the main text, a multi-level discrete model and then a strictly Boolean model were constructed from the PWA system. To illustrate the construction of the transition tables corresponding to the multi-level and Boolean model we next give the complete tables (the full tables can also be found in Chaves et al (2009)).

Table 1 shows the multi-level model rules for *cya*, in the cases  $U = 0$  or  $U = 1$  (the two columns under  $U$  or  $Y^+$  correspond to the cases  $U = 0$  or  $U = 1$ ). The columns  $C$  and  $Y$  contain the multi-level states corresponding to the (continuous) variables  $x_c$  and  $x_y$ , obtained by application of equation (3) in the main text. The column  $Y^+$  shows the synchronous state transition, computed according to equation (4). Columns  $Y_1^+$  and  $Y_2^+$  of Table 1 represent the Boolean variables corresponding to  $Y^+$ , computed according to hypotheses H1 and H2.

Note that both discrete variables  $Y$  and  $C$  have 3 possible values so, according to hypotheses H1 and H2, each of them will give rise to two Boolean variables:  $Y_1, Y_2$  and  $C_1, C_2$ . These are depicted in the first four columns of Table 2. The synchronous Boolean updates for the two *cya* logical variables are shown in the columns  $Y_1^+$  and  $Y_2^+$ . As explained in the text, there are Boolean state combinations which have no biological meaning: these are the rows highlighted in grey and represent the forbidden states in  $S_{D,f}$ . The corresponding entries in columns  $Y_1^+$  and  $Y_2^+$  are filled following points 1 to 3, in Appendix 1 (main text). Therefore, according to Lemma 1, there are no transitions to forbidden states.

All the tables represent the synchronous updates for the discrete and Boolean models. To obtain an asynchronous trajectory, one allows only one of the variables to change at a time.

The transition tables for the other variables were similarly constructed. For the variables *crp* and *fis*, the rules were determined separately for  $U = 0$  and  $U = 1$ . The expression  $H_i^0$  (resp.,  $H_i^1$ ) denotes the Boolean rule for variable  $F_i$  when  $U = 0$  (resp.,  $U = 1$ ).

From the Tables, one can deduce the final updating rules for the Boolean model:

$$\begin{aligned}
U^+ &= U \\
C_1^+ &= 1 \\
C_2^+ &= (\bar{U} \wedge C_1 \wedge \bar{F}_1) \vee (U \wedge C_1 \wedge \bar{F}_2 \wedge \bar{F}_3 \wedge \bar{F}_4) \\
Y_1^+ &= 1 \\
Y_2^+ &= (\bar{U} \wedge Y_1) \vee (U \wedge [(Y_1 \wedge (\bar{C}_1 \vee \bar{C}_2)) \vee ((Y_1 \wedge \bar{Y}_2) \wedge C_1 \wedge C_2)]) \\
G_1^+ &= (\bar{F}_3 \wedge \bar{F}_4) \vee [(F_1 \wedge F_2 \wedge F_3) \vee G_2] \\
G_2^+ &= \bar{F}_3 \wedge \bar{F}_4 \wedge G_1 \wedge (\bar{G}_2 \vee T_1 \vee T_2) \\
T_1^+ &= [\bar{F}_3 \wedge \bar{F}_4 \wedge T_2] \vee [F_1 \wedge F_2 \wedge F_3 \wedge ((\bar{G}_2 \wedge T_2) \vee (G_2 \wedge (T_2 \vee \bar{T}_1)))] \\
T_2^+ &= 0 \\
F_1^+ &= (\bar{U} \wedge H_1^0) \vee (U \wedge H_1^1) \\
F_2^+ &= (\bar{U} \wedge H_2^0) \vee (U \wedge H_2^1) \\
F_3^+ &= (\bar{U} \wedge H_3^0) \vee (U \wedge H_3^1) \\
F_4^+ &= (\bar{U} \wedge H_4^0) \vee (U \wedge H_4^1)
\end{aligned}$$

where

$$\begin{aligned}
H_1^0 &= 1 \\
H_2^0 &= (F_1 \wedge G_1 \wedge \bar{T}_2) \vee (F_1 \wedge F_2 \wedge F_3) \\
H_3^0 &= (F_1 \wedge F_2 \wedge G_1 \wedge \bar{T}_2) \vee (F_1 \wedge F_2 \wedge F_3 \wedge F_4) \\
H_4^0 &= (F_1 \wedge F_2 \wedge F_3 \wedge \bar{F}_4 \wedge G_1 \wedge \bar{T}_2) \\
H_1^1 &= [((\bar{C}_1 \wedge \bar{C}_2) \vee (\bar{Y}_1 \wedge \bar{Y}_2)) \wedge H_1^0] \vee [(C_1 \vee C_2 \vee Y_1 \vee Y_2) \wedge F_1 \wedge F_2] \\
H_2^1 &= [((\bar{C}_1 \wedge \bar{C}_2) \vee (\bar{Y}_1 \wedge \bar{Y}_2)) \wedge H_2^0] \vee [(C_1 \vee C_2 \vee Y_1 \vee Y_2) \wedge F_1 \wedge F_2 \wedge F_3] \\
H_3^1 &= [((\bar{C}_1 \wedge \bar{C}_2) \vee (\bar{Y}_1 \wedge \bar{Y}_2)) \wedge H_3^0] \vee [(C_1 \vee C_2 \vee Y_1 \vee Y_2) \wedge F_1 \wedge F_2 \wedge F_3 \wedge F_4] \\
H_4^1 &= [((\bar{C}_1 \wedge \bar{C}_2) \vee (\bar{Y}_1 \wedge \bar{Y}_2)) \wedge H_4^0]
\end{aligned}$$
