HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

A reconstruction of
Merpaut's table of quarter-squares
(1832)

Denis Roegel

LORIA

2013

(last version: 8 november 2013)

1 The method of quarter-squares

The method of quarter-squares is a multiplication method which makes use of the identity

$$ab = \frac{1}{4} \left((a+b)^2 - (a-b)^2 \right).$$

If we possess a table of squares, and wish to compute the product ab , it is then sufficient to compute $a+b$, $a-b$, to look up the table for these two values, to subtract the values read in the table, and to divide the result by 4. This seems complex, but for large numbers it is more efficient than to compute directly the product.¹

There have been a number of tables of squares around, in particular those of Ludolf published in 1690 [31], and those published by Séguin in 1801 and giving the squares up to 10000. But these authors did mostly not have multiplications in mind, although Ludolf showed how squares could be used to compute a multiplication. At the beginning of the 19th century, the method of quarter-squares was mentioned in passing by Laplace in 1809 [9, p. 261] and Gergonne in 1816 [12, pp. 159–160], but they did not produce tables.

2 The first tables of quarter-squares (1817)

In 1817, Voisin [54] and Bürger [4] published independently the first tables of quarter-squares. Voisin and Bürger both understood that a table of squares could be useful for multiplications, but they went one step beyond, and removed the need to divide the difference of the squares by 4. Their tables gave the quarter-squares for all integers up to 19999 (Bürger) and 20000 (Voisin).

More exactly, when a number is odd, its quarter-square is of the form $n + 0.25$ and Voisin and Bürger only gave the value n . So if a and b are both odd or both even, the values of the quarter-squares are given exactly. If one of the integers is odd and the other is even, both quarter-squares are in default by 0.25, but the difference of these two values is correct. So, although the tables of Voisin and Bürger are not totally accurate for a table of squares, they serve the purpose of a table of multiplication. If one wished to use them as a table of squares, one would need to remember to add 1 to the result multiplied by 4, whenever the value entered is odd.

A table of quarter-squares is also very advantageous with respect to space. Such a table is a linear table, with only one entry. With slightly more work than a mere table of multiplication, it is possible with a table of quarter-squares to do computations that would require many thousands of pages with a conventional table of multiplication, such as Crelle's table [7].

In 1820, in the second edition of his *Philosophy of arithmetic* [30, pp. 246–257], John Leslie described tables of quarter-squares, and in particular Voisin's table, of which he gave an excerpt up to 2000. Leslie expressed the hope that someone would compute a table up to 200000.

¹For a survey of the quarter-square method, see the articles by McFarland [33, 32] and Weiss [55].

| Table | Range | Pages | Density |
|----------------------|--------|-------|---------|
| Voisin (1817) | 20000 | 123 | 162.6 |
| Bürger (1817) | 20000 | 80 | 250.0 |
| Centnerschwer (1825) | 20000 | 40 | 500.0 |
| Merpaut (1832) | 40000 | 400 | 100.0 |
| Kulik (1851) | 30000 | 40 | 750.0 |
| Laundy (1856) | 100000 | 200 | 500.0 |
| Blater (1887) | 200000 | 200 | 1000.0 |
| Bojko (1909) | 20000 | 20 | 1000.0 |
| Plassmann (1933) | 20009 | 200 | 100.0 |

Table 1: A comparison of the main tables of quarter-squares. The density is the ratio of the range by the number of pages. The tables which pack the greatest ranges in the smallest number of pages are those of Blater and Bojko.

3 Later tables of quarter-squares

A number of other tables of quarter-squares were published during the 19th century (table 1). Centnerschwer [5] published a table of quarter-squares up to 20000 in 1825, Kulik in 1833 and 1851 (up to 30000) [23, 24], Merpaut in 1832 (up to 40000, and described here) [34], Laundy in 1856 [28], and Blater in 1887 [2]. Laundy's table gave the quarter-squares up to 100000, whereas Blater extended it to 200000. In 1836, Galbraith published a small table of quarter-squares in a more general collection of tables [11]. This table was probably borrowed from Voisin's table.

In the preface of his table of quarter-squares [28, p. iv], Laundy also mentions that Peter Gray had in his possession a manuscript of a table of quarter-squares extending to 200000 by Shortrede, but that table was never published.

There have also been several applications of quarter-squares for mechanical aids. In 1829, Schiereck invented a calculating machine based on quarter-squares [56] and in 1841 he devised an instrument for the measurement of the area of triangles, useful in surveying, and also based on quarter-squares [51, 20].

In a book published in 1857, Edward Sang also suggested the use of quarter-squares for multiplications [6, pp. 50–51].

The use of quarter-squares declined in the first half of the 20th century [33], but Bojko in 1909 [3] and Plassmann in 1933 [39] each published tables of quarter-squares up to 20000. In the 1950s, however, new applications of the quarter-squares method for multiplication on analog devices surfaced, and this prompted their use for the implementation of multiplication in digital processors [21, 22].

Finally, we mention that tables of triangular numbers can also be used in a way similar to quarter-squares in order to facilitate the multiplications [8].

4 Merpaut (1786–18??)

Jean-Marie Merpaut-Duzélidest was born on the 15th of January 1786 in Uzel [19, pp. 91–92].²

In 1832, he was professor of mathematics at the high school of Vannes. Later he became the principal of the high school of Lannion. In the 1830s, he was also inspector of primary schools in the *département* of the Loire-Inférieure, a position from which he resigned in 1840 [1, p. 185]. In 1855, he was inspector of primary schools in Compiègne, and in 1857 he retired.³

In 1832, he published a table of quarter-squares, which he called “arithmomes” [34]. The table itself was titled “Tables arithmonomiques, fondées sur le rapport du rectangle au carré”, suggesting that Merpaut related the multiplication (rectangles) to squares. Another work based on quarter-squares was his “science arithmonomique” published in 1842 [35]. The latter was interestingly subtitled “the logarithms of young ladies, computed by themselves, by learning the addition.” We haven’t seen any of these works, but it is to be assumed that Merpaut explained the construction of the tables, and how they could easily be checked.

In 1845, his “Mémoire sur les colonnes arithmonomiques” was deposited at the French Academy of Sciences [36].

Merpaut seems to have been interested in means to simplify computations, and in 1847, he even patented a “machine” he called “bureau universel du calculateur,” that is, the “computer’s universal desk.”⁴

5 Structure of Merpaut’s table and reconstruction

We have not seen Merpaut’s actual table which seems to be very rare, and our reconstruction is based on the sketch given by Laundy in 1856 [28, pp. v–vi], [26]. It is to be expected that the actual table slightly differs from our reconstruction, but perhaps not too much.

Merpaut’s table gives the quarter-squares up to 39999, thus going beyond the tables of Voisin, Buerger and Centnerschwer which all stopped at 20000. Merpaut gives 100 quarter-squares per page, and his table therefore occupies 400 pages. The pages are numbered 0,0 to 39,9 and these are the hundreds of the index. The tens are then given by the columns and the units by the lines. The last page of the tables therefore gives the quarter-squares from 39900 to 39999. The quarter-square if 39937, for instance, is found at the intersection of column 3 and line 7 of that page and reads

398
740
992

and this represents the value 398740992.

²The French National Archives have a file on Merpaut (AN F17/21313), but we have not consulted it.

³For some background on school inspectors in general, and on Merpaut in particular, see Nicolas’ article [37].

⁴French Patent 5060, dated 20 March 1847.

References

The following list covers the most important references⁵ related to Merpaut's table. Not all items of this list are mentioned in the text, and the sources which have not been seen are marked so. We have added notes about the contents of the articles in certain cases.

⁵**Note on the titles of the works:** Original titles come with many idiosyncrasies and features (line splitting, size, fonts, etc.) which can often not be reproduced in a list of references. It has therefore seemed pointless to capitalize works according to conventions which not only have no relation with the original work, but also do not restore the title entirely. In the following list of references, most title words (except in German) will therefore be left uncapitalized. The names of the authors have also been homogenized and initials expanded, as much as possible.

The reader should keep in mind that this list is not meant as a facsimile of the original works. The original style information could no doubt have been added as a note, but we have not done it here.
