HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L’archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.
Necessary Conditions for Implicit and DAE Control Systems

Maria do Rosário de Pinho

University of Porto, Faculdade de Engenharia
Motivation

- Connection between Implicit Systems and DAE
- Recent Work on DAE (MG presentation in Bayreuth, e.g.)
- Questions on NC for Implicit Systems
  - Answer: see paper [1]
  - Really? Theorem 6.1? Theorem 7.1? How??????

This is, then, a clarification on applicability of results in [1] and… we introduce a hybrid version of Theorem 6.1

---

Outline

- Implicit System Optimal Control Problem
- Necessary Conditions and the Hybrid Version
- Special Cases: 1, 2 and 3
- Alternative NCO for cases 2 and 3
- Implicit Problems with Additional Constraints
  - How to deal with equality state constraints

Flavor of Future work
Implicit System OC Problem

Minimize \( l(x(a), x(b)) \)
subject to
\[
0 = f(t, x(t), \dot{x}(t), u(t)) \text{ a.e.} \\
u(t) \in U \text{ a.e.} \\
(x(a), x(b)) \in E
\]

where
\[
l : \mathbb{R}^n \times \mathbb{R}^n \rightarrow \mathbb{R} \\
f : [a, b] \times \mathbb{R}^n \times \mathbb{R}^n \times \mathbb{R}^k \rightarrow \mathbb{R}^N \\
U \subset \mathbb{R}^k \text{ is compact} \\
E \subset \mathbb{R}^n \times \mathbb{R}^n \text{ closed set}
\]
Essential here is the following **Reformulation**

\[
\begin{align*}
\dot{x}(t) &= v, \\
0 &= f(t, x, v, u).
\end{align*}
\]  

We say that an admissible process for \((P)\) is \((x^*, u^*)\) is a *local minimum* when it minimizes the cost \(l(x(a), x(b))\) over all the admissible processes \((x, v, u)\) such that

\[|x(t) - x^*(t)| \leq \varepsilon\]

for some \(\varepsilon > 0\).

**Introducing:**

\[S(t) := \{(x, v, u) : (f(t, x, v, u), u) \in \Phi \times U\}, \quad \Phi = \{0\}\]

\[S^*_\varepsilon(t) := \{(x, v, u) \in S(t) : |x(t) - x^*(t)| \leq \varepsilon\}\]

\[S(t, u) := \{(x, v) : f(t, x, v, u) \in \Phi\}, \quad u \in U\]

\[S^*_\varepsilon(t, u) := \{(x, v) \in S(t, u) : |x(t) - x^*(t)| \leq \varepsilon\}\]

For hybrid case
Assumptions

The function $l$ is locally Lipchitz, $E$ closed, $U$ compact.

The function $(t, x, v, u) \to f(t, x, v, u)$ is $\mathcal{L} \times \mathcal{B}$ measurable.

There exists a constant $k_f$ such that, for a.e. $t \in [a, b]$, for every $u \in U$, $(x_i, v_i, u_i)$ in a neigh. of $S_\epsilon^*(t)$, we have

$$|f(t, x_1, v_1, u_1) - f(t, x_2, v_2, u_2)| \leq k_f[|x_1 - x_2| + |v_1 - v_2| + |u_1 - u_2|].$$

There exists constant $M$ such that, for a.e. $t \in [a, b]$, $(x_i, v_i, u_i) \in S_\epsilon^*(t)$:

\[(BS)\quad (\alpha, \beta, \gamma) \in N^P_{S(t)}(x, v, u) \implies |\alpha| \leq M|\beta, \gamma|.\]
There exist \( p \in W^{1,1}([a, b]; \mathbb{R}^n) \) and a scalar \( \lambda_0 \geq 0 \) such that:

\[
||p||_\infty + \lambda_0 > 0,
\]

\[
(p(a), -p(b)) \in N^L_E(x^*(a), x^*(b)) + \lambda_0 \partial^L l(x^*(a), x^*(b)),
\]

For almost every \( t \in [a, b] \)

\[
(-\dot{p}(t), 0, 0) \in \partial^C_{x,v,u} \langle p(t), \dot{x}^*(t) \rangle - N^C_{S(t)}(x^*(t), \dot{x}^*(t), u^*(t))
\]

For all \( u \in U, (x^*(t), v) \) such that \( f(t, x^*(t), v, u) = 0 \),

\[
\langle p(t), v \rangle \leq \langle p(t), \dot{x}^*(t) \rangle.
\]

(W)
Hybrid Version of Theorem 6.1 in [1]

proved by “putting together”

Theorem 3.2 with Theorem 6.1
Assumptions: what changes

For almost every $t \in [a, b]$, for every $(x_i, v_i, u_i)$ with $|x_i - x^*(t)| \leq \varepsilon$, we have

$$|f(t, x_1, v_1, u_1) - f(t, x_2, v_2, u_2)| \leq k_\psi [ |x_1 - x_2| + |v_1 - v_2| + |u_1 - u_2|].$$

(L)

For almost every $t \in [a, b]$, for every $u \in U$, $(x_i, v_i)$ in a neigh. of $S^*_\varepsilon(t, u)$, we have

$$|f(t, x_1, v_1, u) - f(t, x_2, v_2, u)| \leq k_f [ |x_1 - x_2| + |v_1 - v_2|].$$

(BS)

There exists constant $M$ such that, for a.e. $t \in [a, b]$, $(x_i, v_i, u_i) \in S^*_\varepsilon(t)$:

$$(\alpha, \beta, \gamma) \in N^P_{S(t)}(x, v, u) \implies |\alpha| \leq M |(\beta, \gamma)|.$$

There exists constant $M$ such that, for a.e. $t \in [a, b]$, $u \in U$:

$$(x, v) \in S^*_\varepsilon(t, u), \ (\alpha, \beta) \in N^P_{S(t, u)} \implies |\alpha| \leq M |\beta|. $$
NCO: Hybrid Theorem 6.1

There exist $p \in W^{1,1}([a, b]; \mathbb{R}^n)$ and a scalar $\lambda_0 \geq 0$ such that:

$$||p||_\infty + \lambda_0 > 0,$$

$$(p(a), -p(b)) \in N^{L}_E(x^*(a), x^*(b)) + \lambda_0 \partial L(x^*(a), x^*(b)),$$

For almost every $t \in [a, b]$

$$(-\dot{p}(t), 0, 0) \in \partial^C_{x, v, u} \langle p(t), \dot{x}^*(t) \rangle - N^C_S(t)(x^*(t), \dot{x}^*(t), u^*(t))$$

For all $u \in U, (x^*(t), v)$ such that $f(t, x^*(t), v, u) = 0,$

$$\langle p(t), v \rangle \leq \langle p(t), \dot{x}^*(t) \rangle.$$
We have two difficulties:

Bounded Slope (BS) assumption and Euler inclusion in NCO

Both defined in terms of normal cones…but, as far as (BS),

For all $\lambda \in \mathbb{R}^N$, we have

$$(\alpha, \beta) \in \partial^L_{x,v} \langle \lambda, f(t,x,v,u) \rangle \implies |\lambda| \leq K_S |\beta|.$$  

↓

(BS) with $M = K_S k_f$

And in the Smooth Case…
**Smooth Case** (hybrid)

Suppose \((x, v, u) \rightarrow f(t, x, u, v)\) is \(C^1\). Then our assumption

\[
\text{For all } \lambda \in \mathbb{R}^N, \ (\alpha, \beta) \in \partial_{x,v}^L \langle \lambda, f(t, x, v, u) \rangle \implies |\lambda| \leq K_S |\beta|.
\]

\[
\downarrow
\]

\[
\text{For all } \lambda \in \mathbb{R}^N, \nabla_v \langle \lambda, f(t, x, v, u) \rangle = 0 \implies \lambda = 0.
\]

Meaning that the \((N)\) rows of

\[J_v f(t, x, v, u) \in \mathcal{M}_{N \times n}\]

are linearly independent, i.e., the matrix \(J_v f(t, x, v, u)\) has **full row rank**.

So \((n \geq N)\).
Smooth Case (full row rank)

\[ (-\dot{p}(t), 0) \in \partial^{\infty}_{x,v} \langle p(t), \dot{x}^*(t) \rangle - N^C_S(t, u^*(t))(x^*(t), \dot{x}^*(t)) \]

\[ \downarrow \]

\[ (-\dot{p}(t), 0) = \langle p(t), \dot{x}^*(t) \rangle - \nabla_{x,v} \langle \lambda(t), f(t, x^*(t), \dot{x}^*(t), u^*(t)) \rangle \]

And, by (W), we get \( \mu(t) \in N^C_U(u^*(t)) \):

\[ -\mu(t) = \nabla_u \langle \lambda(t), f(t, x^*(t), \dot{x}^*(t), u^*(t)) \rangle. \]

Summarizing we have \( \lambda(t) \in \mathbb{R}^N \) and \( \mu(t) \in N^C_U(u^*(t)) \):

\[ \begin{aligned}
\dot{p}(t) &= \nabla_x \langle \lambda(t), f(t, x^*(t), \dot{x}^*(t), u^*(t)) \rangle \\
p(t) &= \nabla_v \langle \lambda(t), f(t, x^*(t), \dot{x}^*(t), u^*(t)) \rangle \\
-\mu(t) &= \nabla_u \langle \lambda(t), f(t, x^*(t), \dot{x}^*(t), u^*(t)) \rangle
\end{aligned} \]

\( (NC) \)

and \( |\lambda(t)| \leq K_S |p(t)| \).
Special Case

Let $f(t, x, v, u) = Ev - \tilde{f}(t, x, u)$, $E \in \mathcal{M}_{N \times n}$, $\text{rank}(E) = r$.

Case 1: $E$ constant and with full row rank i.e., $r = N$. Then $N \leq n$.

We have $EE^T \in \mathcal{M}_{N \times N}$ nonsingular and from (NC) we get

$$\lambda(t) = (EE^T)^{-1} Ep(t)$$

and then

$$
\begin{aligned}
-\dot{p}(t) &= \nabla_x \langle (EE^T)^{-1} Ep(t), \tilde{f}(t, x^*(t), u^*(t)) \rangle \\
\mu(t) &= \nabla_u \langle (EE^T)^{-1} Ep(t), \tilde{f}(t, x^*(t), u^*(t)) \rangle 
\end{aligned}
$$

(2)
Special Case

If $E = [I \ 0]$, then with $x = (y, z) \in \mathbb{R}^N \times \mathbb{R}^{n-N}$ and $f(t, x, \dot{x}, u) = 0$ becomes

$$\dot{y} - \tilde{f}(t, y, z, u) = 0.$$ 

Here $z$ is a state. Our problem is now written as

$$
(P) \begin{cases} 
\text{Minimize} & l(y(a), z(a), y(b), z(b)) \\
\text{subject to} & \dot{y}(t) - \tilde{f}(t, y(t), z(t), u(t)) = 0 \text{ a.e.} \\
& u(t) \in U \text{ a.e.} \\
& (y(a), z(a), y(b), z(b)) \in E
\end{cases}
$$

Let us write all the details of the NCO.

Set

$$p = (p_1, p_2) \in \mathbb{R}^N \times \mathbb{R}^{n-N}.$$
NCO for Special Case

\[ ||p||_\infty + \lambda_0 > 0, \]

\[-\dot{p}(t) = \nabla_x \langle p_1(t), \tilde{f}(t, y^*(t), z^*(t), u^*(t)) \rangle \]

\[ \mu(t) = \nabla_u \langle p_1(t), \tilde{f}(t, y^*(t), z^*(t), u^*(t)) \rangle \]

\[ \max_{u \in U} \langle p_1(t), \tilde{f}(t, y^*(t), z^*(t), u) \rangle = \langle p_1(t), \tilde{f}(t, y^*(t), z^*(t), u^*(t)) \rangle. \]

\[ (p_1(a), p_2(a), -p_1(b), -p_2(b)) \in N_E^L(y^*(a), z^*(a), y^*(b), z^*(b)) + \lambda_0 \partial^L l(y^*(a), z^*(a), y^*(b), z^*(b)), \]

Recall we are assuming \( x = (y, z) \) and

\[ f(t, x, v, u) = Ev - \tilde{f}(t, x, u), \quad E \in \mathcal{M}_{N \times n}, \quad n \geq N, \quad \text{rank}(E) = N. \]
Now…Case 2 and 3

Application of Theorem is not possible because

\[
\text{rank}(J_v f(t, x, v, u)) < N
\]

How to compensate for lack of rank of E?
What if the matrix $E$ is not of full row rank?

**Case 2:** $n \leq N$ and $\text{rank}(E) = n$, i.e., $E$ of full column rank.

For simplicity: $E = \begin{bmatrix} E_c \\ 0 \end{bmatrix}$ and $\tilde{f} = \begin{bmatrix} \tilde{f}_1 \\ \tilde{f}_2 \end{bmatrix}$.

$$Ev - \tilde{f}(t, x, u) \longrightarrow \begin{cases} \dot{x}(t) = E_c^{-1} \tilde{f}_1(t, x, u) \\ 0 = \tilde{f}_2(t, x, u) \end{cases}$$

**Case 3:** $\text{rank}(E) = r < \min\{n, N\}$, $r > 0$.

For simplicity: $E = \begin{bmatrix} E_r \\ 0 \\ 0 \end{bmatrix}$, $x = (y, z) \in \mathbb{R}^r \times \mathbb{R}^{n-r}$ and $\tilde{f} = \begin{bmatrix} \tilde{f}_d \\ \tilde{f}_a \end{bmatrix}$.

$$Ev - \tilde{f}(t, x, u) \longrightarrow \begin{cases} \dot{y}(t) = E_c^{-1} \tilde{f}_d(t, y, z, u) \\ 0 = \tilde{f}_a(t, y, z, u) \end{cases}$$
Case 3 (semi-explicit DAE)

\[ Ev - \tilde{f}(t, x, u) \implies \begin{cases} \dot{y}(t) = E_c^{-1} \tilde{f}_d(t, y, z, u) \\ 0 = \tilde{f}_a(t, y, z, u) \end{cases} \]

Can we treat \( z \) as a control? If yes, take \( w = (z, u) \) as the control variable.

Minimize subject to \( l(y(a), y(b)) \)

\[(P_3) \begin{cases} \dot{y}(t) = E_c^{-1} \tilde{f}_d(t, y(t), z(t), u(t)) \text{ a.e.} \\ 0 = \tilde{f}_a(t, y(t), z(t), u(t)) \text{ a.e.} \\ u(t) \in U \text{ a.e.} \\ (y(a), y(b)) \in E \end{cases} \]

If \( \forall \lambda \in \mathbb{R}^{N-r}, \nabla_z \langle \lambda, \tilde{f}_a(t, y, z, u) \rangle = 0 \implies \lambda = 0 \), we have an **index one** DAE.

For nonsmooth \( \tilde{f} \), see hybrid NCO for mixed constrained problems (Th. 7.4 in [1]).
Case 3  (semi-explicit DAE)

But...

- what if we can treat $z$ as a control but

$$\forall \lambda \in \mathbb{R}^{N-r}, \nabla_z (\lambda, \tilde{f}_a(t, y, z, u)) = 0 \Rightarrow \lambda = 0?$$

Does

$$\forall \lambda \in \mathbb{R}^{N-r}, \nabla_{z,u} (\lambda, \tilde{f}_a(t, y, z, u)) \in -N^C_U(u) \Rightarrow \lambda = 0$$

hold?

If it does and Lipschitz conditions with respect to $u$ also hold, apply Theorem 7.1 in [1] (NCO for mixed constraints, not hybrid).

We assume $(x,v,u)\rightarrow f(t,x,v,u)$ to be loc. Lipschitz
• what if $z$ cannot be treated as a control?

(1) Go back to

\[
\begin{align*}
\dot{x}(t) &= v, \\
0 &= f(t, x, v, u).
\end{align*}
\]

(2) If $(x, v, u) \to f(t, x, v, v)$ is locally Lipschitz and, for all $\lambda \in \mathbb{R}^N$, we have

\[
(\alpha, \beta, \gamma) \in \partial_{x,v,u}^L \langle \lambda, f(t, x, v, u) \rangle \implies |\lambda| \leq M|\langle \beta, \gamma \rangle|,
\]

then **THEOREM 6.1** applies.

If $(x, v, u) \to f(t, x, v, v)$ is strict differentiable at $(x^*(t), \dot{x}^*(t), u^*(t))$, then

\[
\begin{align*}
\dot{p}(t) &= \nabla_x \langle \lambda(t), f(t, x^*(t), \dot{x}^*(t), u^*(t)) \rangle \\
p(t) &= \nabla_v \langle \lambda(t), f(t, x^*(t), \dot{x}^*(t), u^*(t)) \rangle \\
-\mu(t) &= \nabla_u \langle \lambda(t), f(t, x^*(t), \dot{x}^*(t), u^*(t)) \rangle
\end{align*}
\]
Summarizing the Smooth Special Cases

\[ f(t, x, v, u) = Ev - \tilde{f}(t, x, v, u), \text{ } f \text{ smooth, } E \in \mathcal{M}_{N \times n}. \]

- Case 1. \( N \leq n \) and rank \( J_v \tilde{f}(t, x, v, u) = N \).
  Apply Hybrid version of Theorem 6.1 presented here.

- Case 2. \( N \geq n \) and rank \( J_v \tilde{f}(t, x, v, u) = n \).
  Mixed constraint Apply Theorem 7.1 in [1].

- Case 3. rank \( J_v \tilde{f}(t, x, v, u) < \min\{n, N\} \): Semi-explicit DAE.
  
  ★ Case 3.a). Control is now \( w = (z, u) \). \textcolor{red}{z seen as a control}
  Mixed constraint Apply 7.1 or hybrid version of it.

  ★ Case 3.b). Control is \( u \) only. \textcolor{red}{z seen as a state}
  Theorem 6.1 if... Use initial formulation and compensate lack of rank of \( E \).

Approach applies also to Nonsmooth Problems
Implicit Systems with Additional Constraints

Based on latest developments (Boccia, Bettiol, & Vinter in SICOP 2013 and A. Boccia 2014) Theorem 7.1 and Theorem 6.1 can now be adapted to cover additional state and mixed constraints. This means we can now treat the problem

Minimize \( l(x(a), x(b)) \)

subject to

\[
0 = f(t, x(t), \dot{x}(t), u(t)) \text{ a.e.}
\]

\[
0 \geq g(t, x(t), u(t)) \text{ a.e.}
\]

\[
0 = b(t, x(t), u(t)) \text{ a.e.}
\]

\[
0 \geq h(t, x(t)) \text{ for all } t
\]

\[
u(t) \in U \text{ a.e.}
\]

\[
(x(a), x(b)) \in E
\]
Extra Equality State Constraints

Minimize \( l(x(a), x(b)) \)
subject to
\[
0 = f(t, x(t), \dot{x}(t), u(t)) \quad \text{a.e.}
\]
\[
0 \geq g(t, x(t), u(t)) \quad \text{a.e.}
\]
\[
0 = b(t, x(t), u(t)) \quad \text{a.e.}
\]
\[
0 \geq h_1(t, x(t)) \text{ for all } t
\]
\[
0 = h_2(t, x(t)) \text{ for all } t
\]
\( u(t) \in U \text{ a.e.} \)
\( (x(a), x(b)) \in E \)
How to deal with Equality State Constraints

0 = h_2(t, x(t)) for all t

If we can differentiate h:

\[ h_t + b_x \dot{x}(t) = 0 \quad \dot{x}(t) \equiv v \quad h_t + h_x v = 0 \]

Mixed constraint.

Any admissible x is such that \( x(t) \in h_2^{-1}(0) \).

We can write \( x(t) \in X(t) \), where \( X(t) = \{x : (h_1(t, x), h_2(t, x)) \in \mathbb{R}_- \times \{0\} \} \).

Or we can plug \( x(t) \in h_2^{-1}(0) \) in the definition of local minimum.

Will NCO hold?

Or .... some more ideas?

No multiplier!!!
Thank you for the attention

Special Thanks to the Organizers of NETCO 14
Invitation to meet in Cascais September 8-10, 2014
