HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

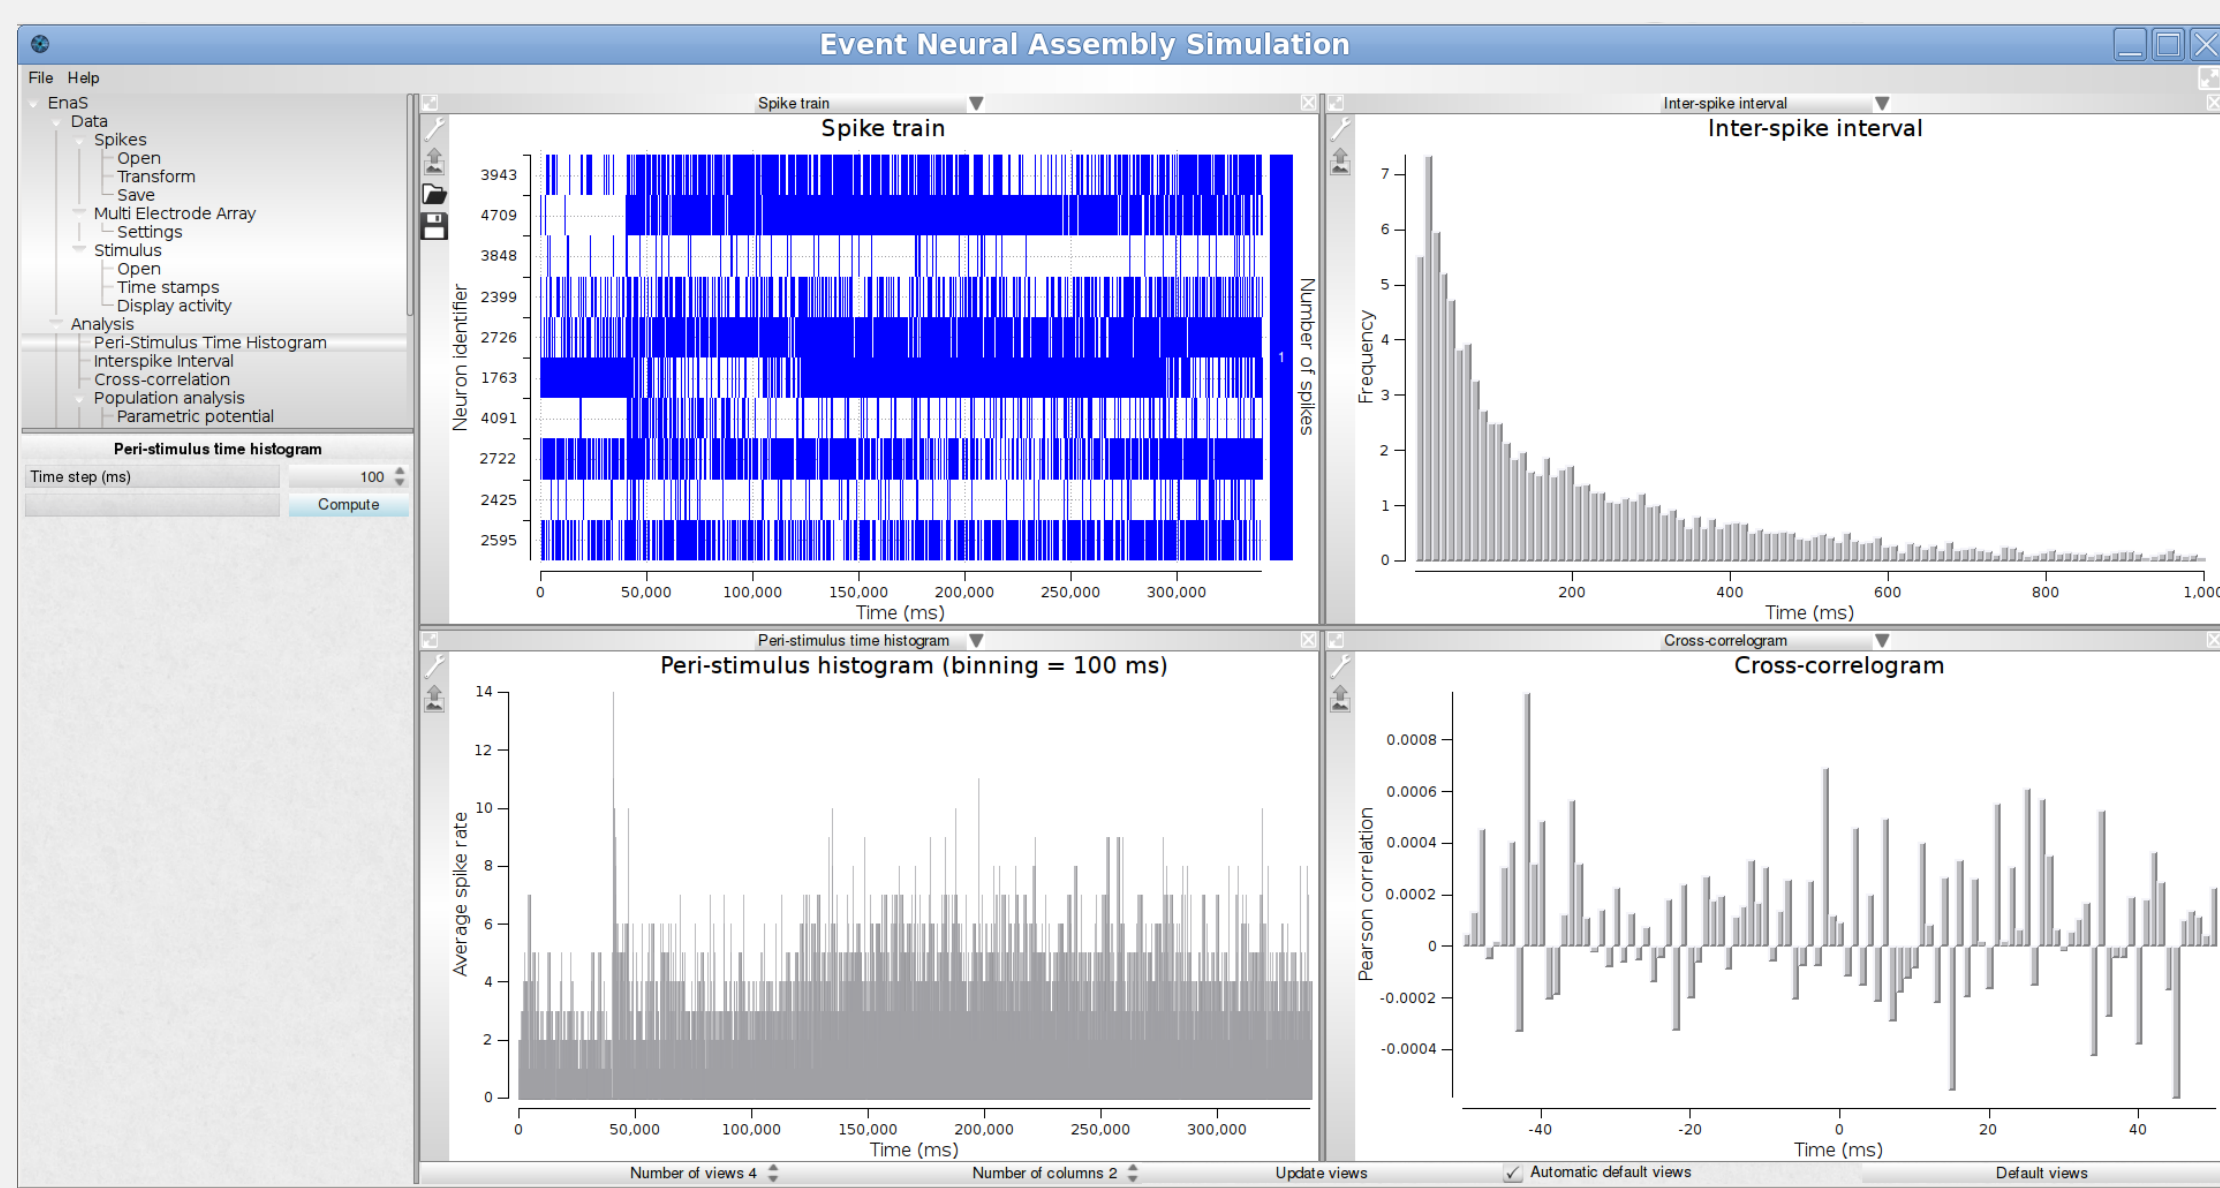

HAL Authorization

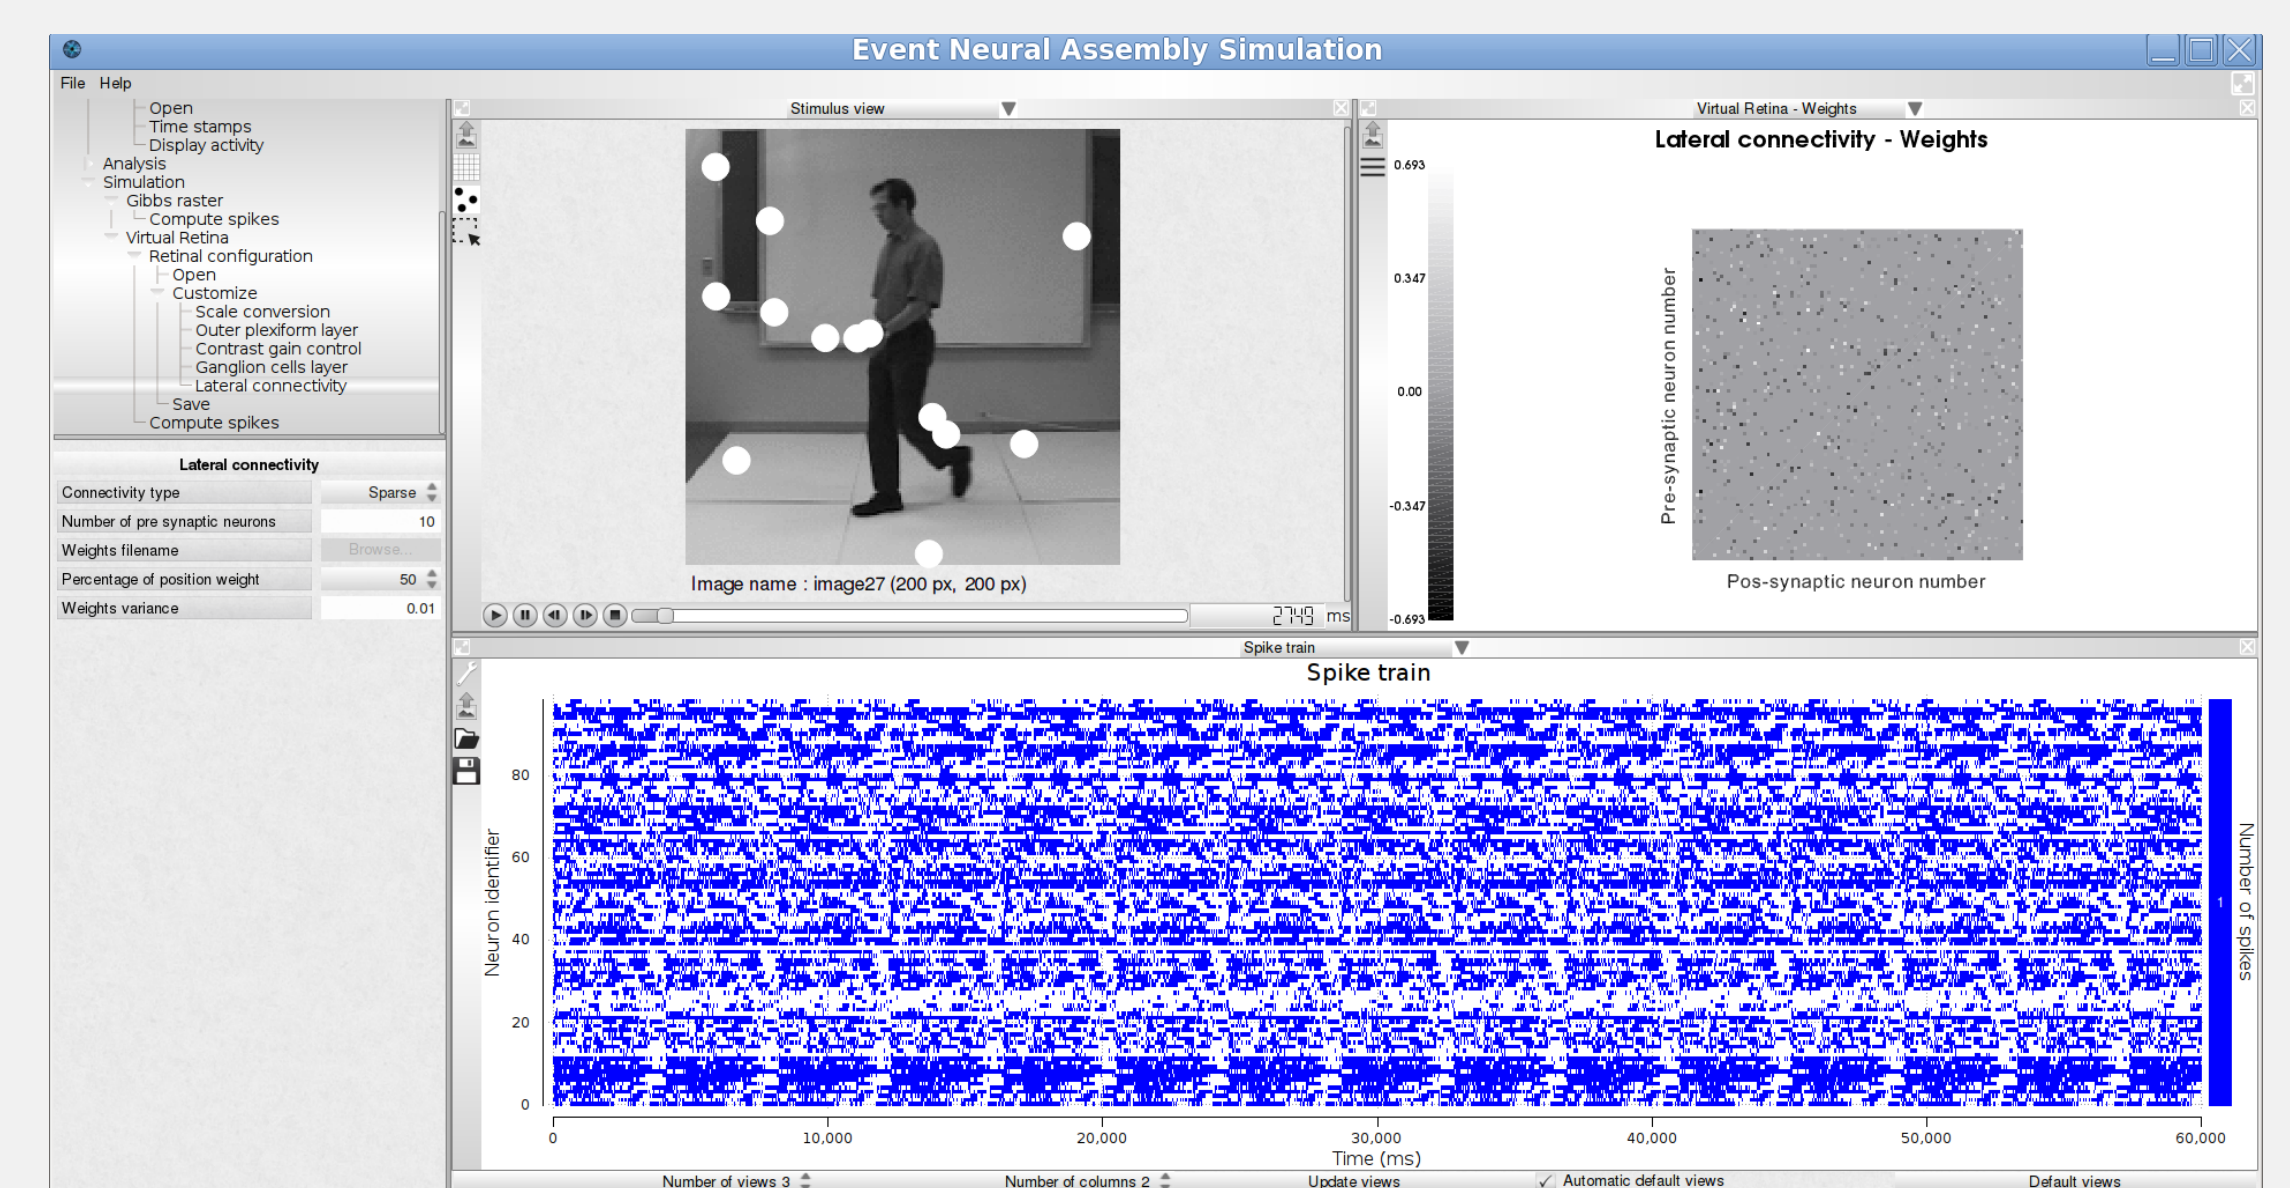

ENAS A new software for spike train analysis and simulation

As one gains more intuitions and results on the importance of concerted activity in spike trains, models are developed to extract potential canonical principles underlying spike coding. These methods shed a new light on spike train dynamics. However, they require time and expertise to be implemented efficiently, making them hard to use on a daily basis by neuroscientists or modelers. To bridge this gap, we developed the license free multiplatform software ENAS integrating tools for spike trains analysis and simulation.

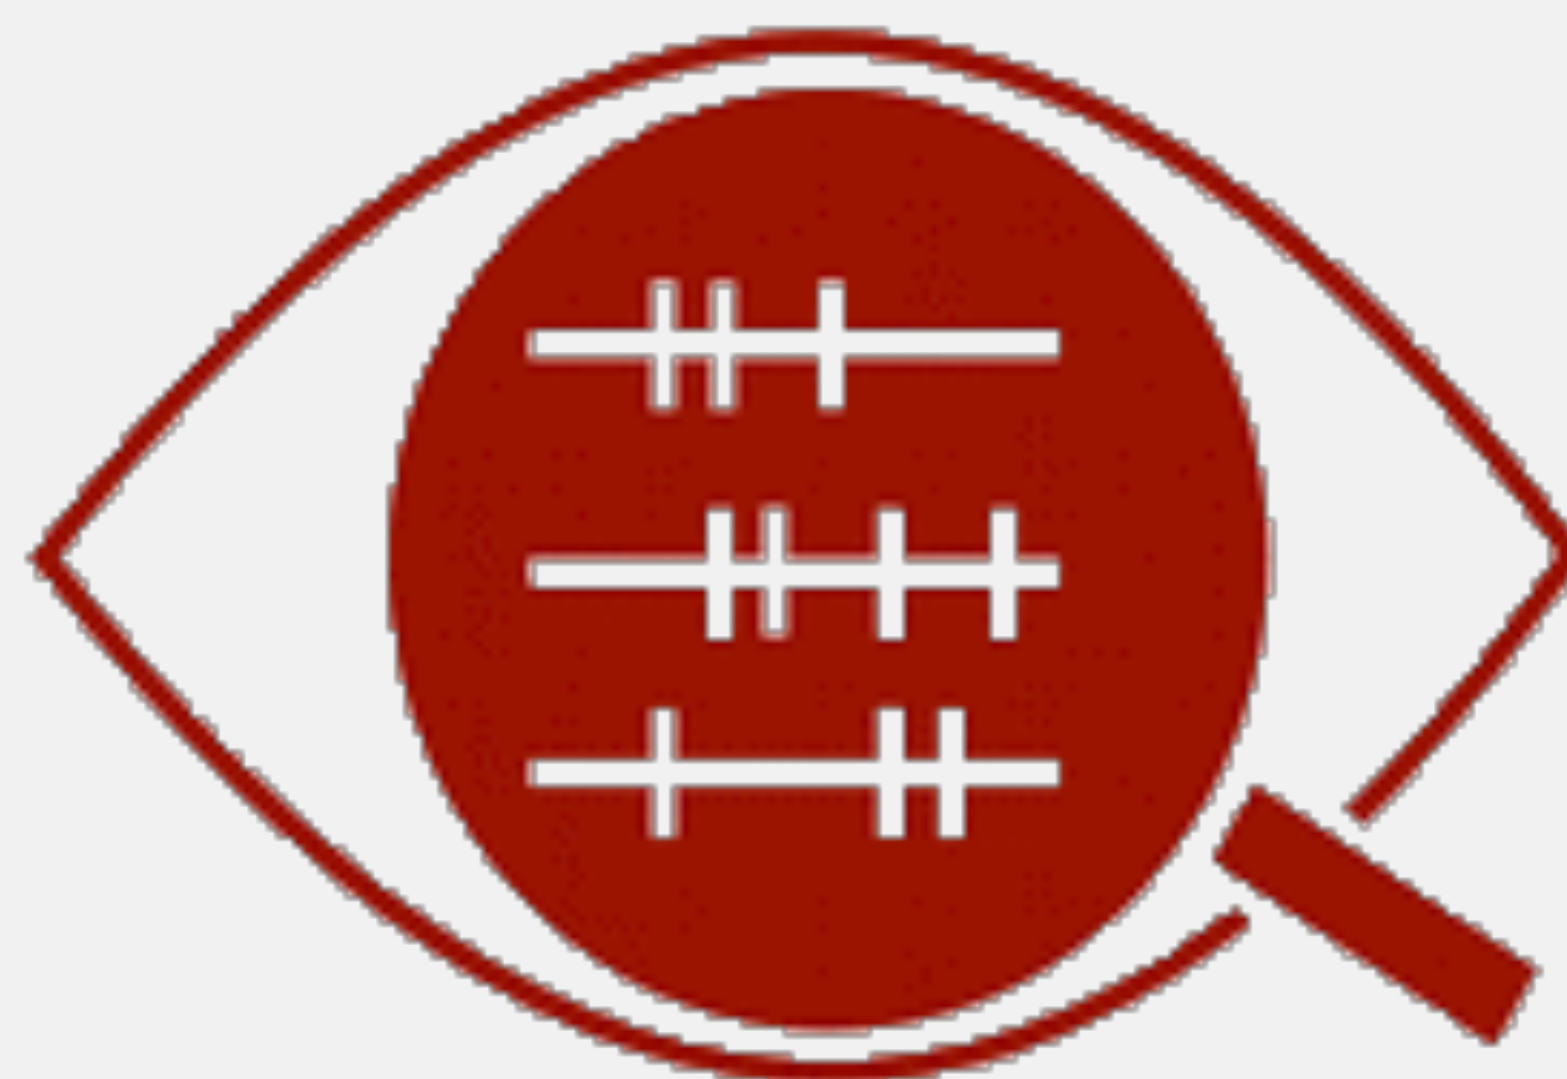

Standard analysis

Virtual Retina simulator

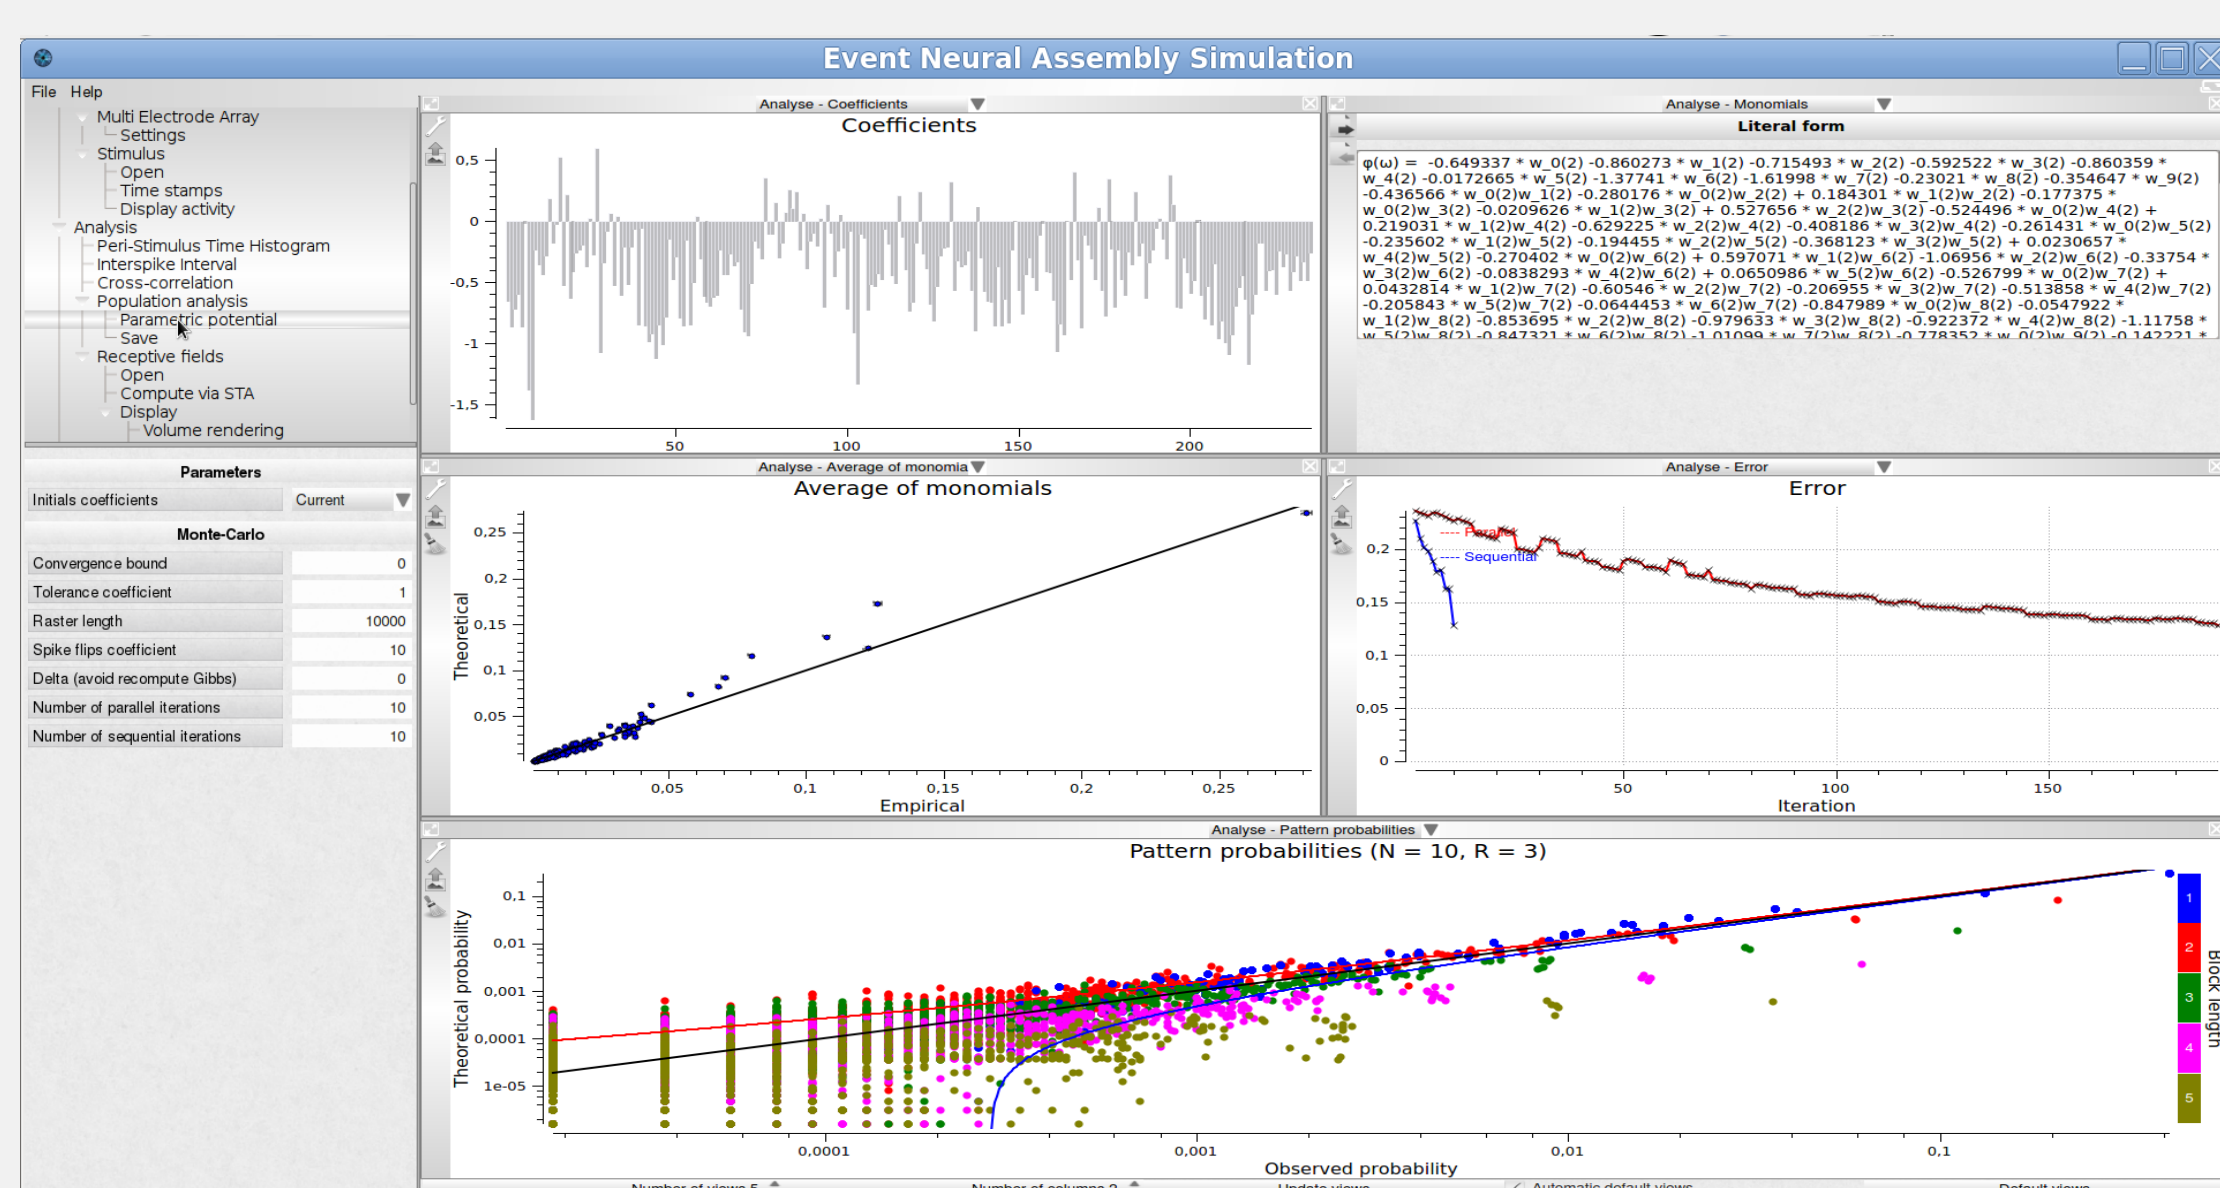

ENAS provides statistical analysis with Maximum Entropy-Gibbs distributions taking into account both spatial and temporal correlations as constraints, allowing to introduce causality and memory in statistics.

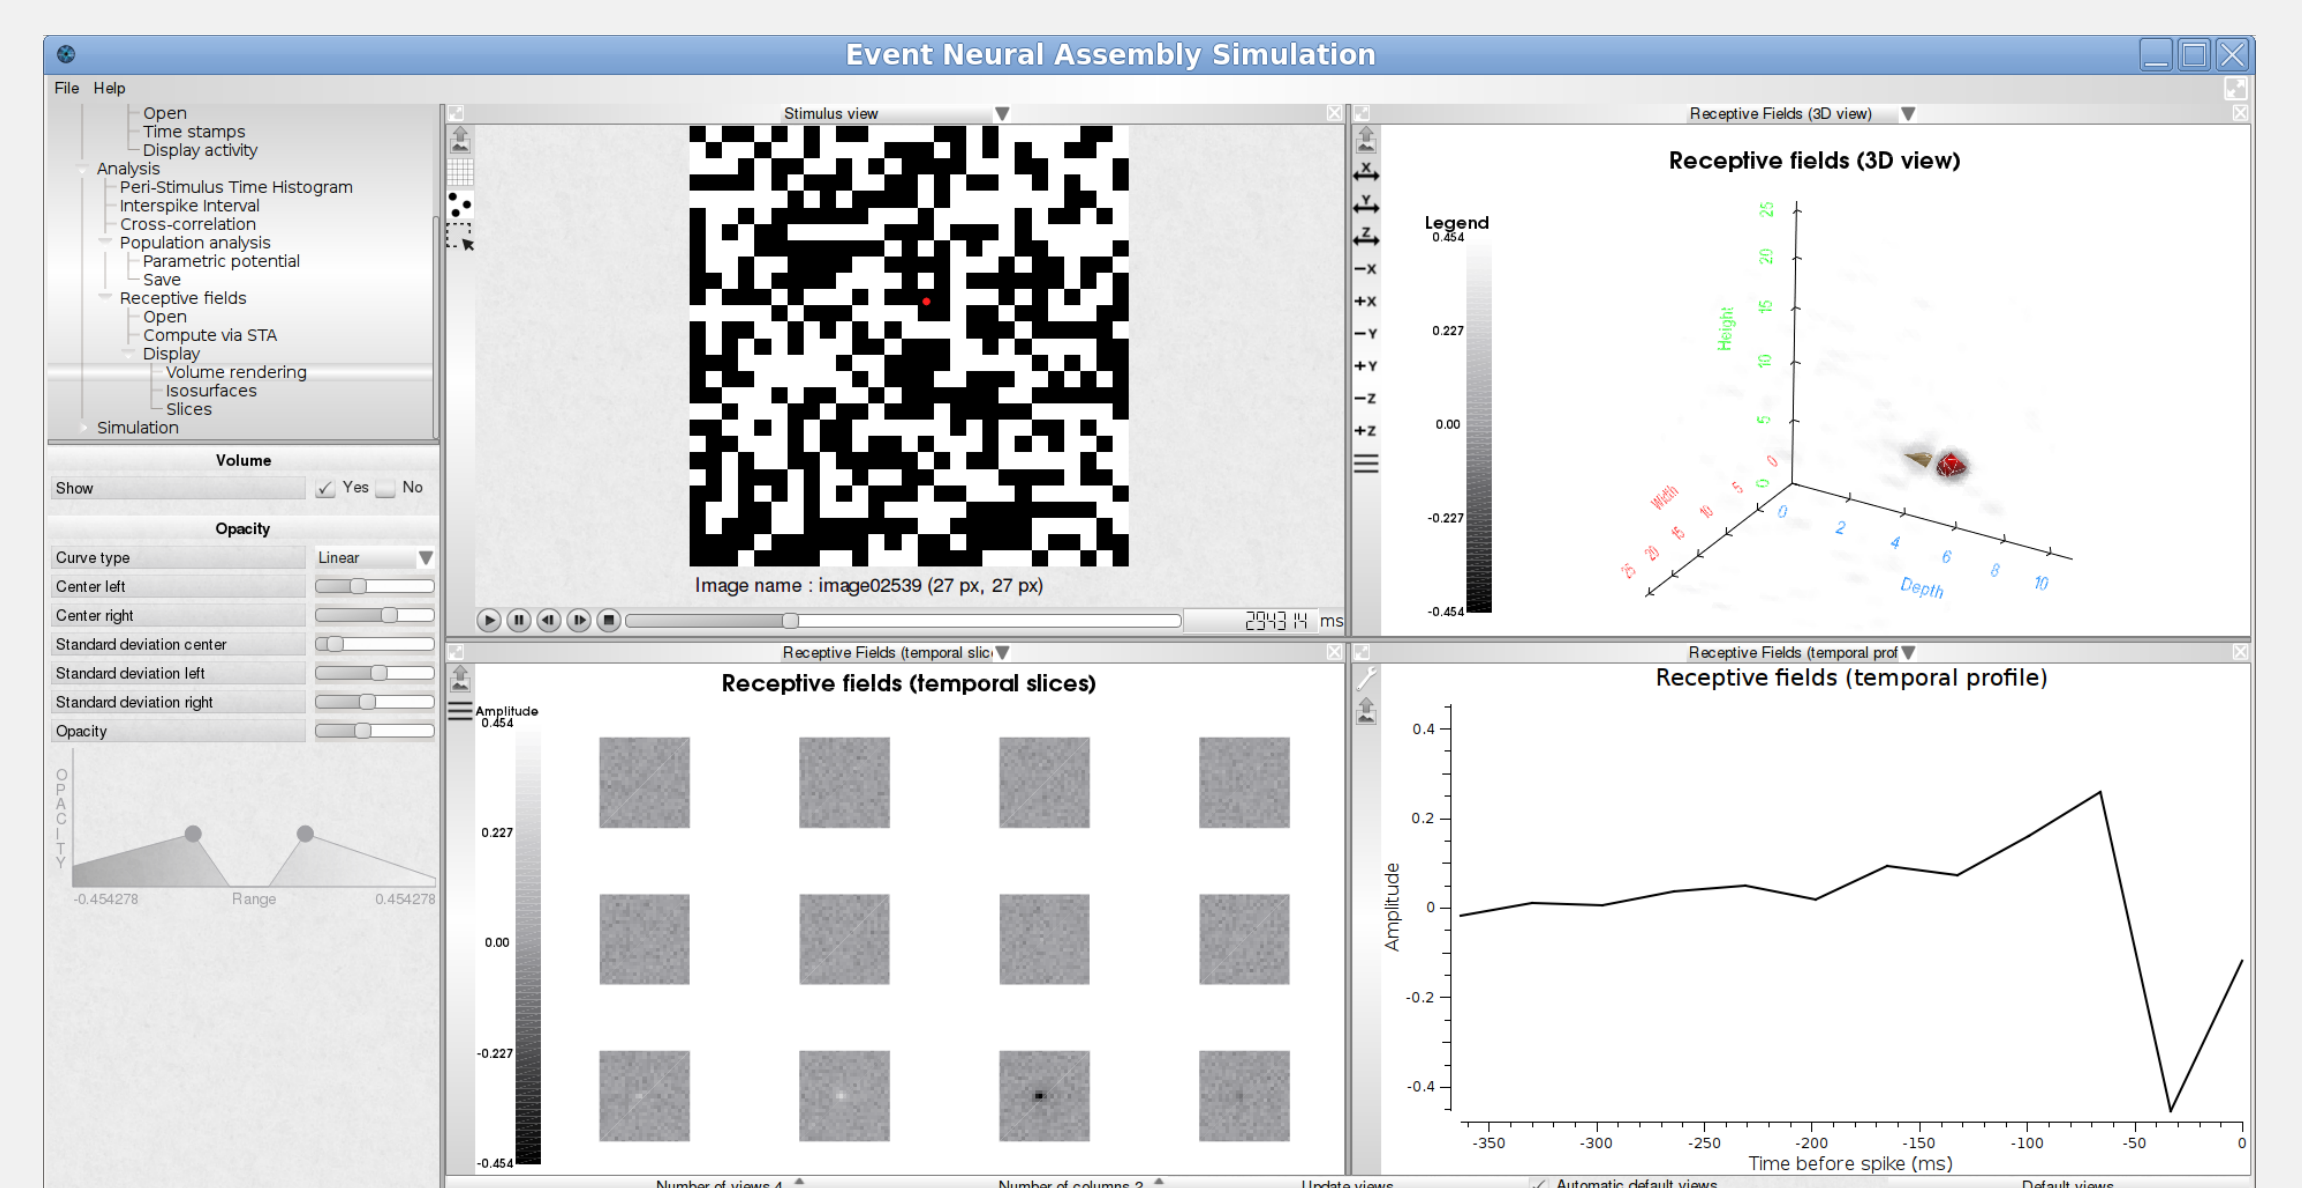

ENAS includes a virtual retina simulator that includes feedback connections from the bipolar to the OPL layer and lateral connections in the IPL. This simulator maps images into spikes in a bio plausible way.

Spatio-temporal analysis

Receptive field estimation

Other features: Crop and bin rasters, select neurons subsets according to different criteria, set MEA array configuration, generate rasters from given statistics

Multi-platform

Linux, MacOS, Windows

Fast

Parallel computing

GUI

User-friendly

Free
