HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L’archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d’enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

B.1 Introduction

Knowledge

- Increase awareness on IoT paradigm
- Update knowledge on the impact of air quality in daily lives

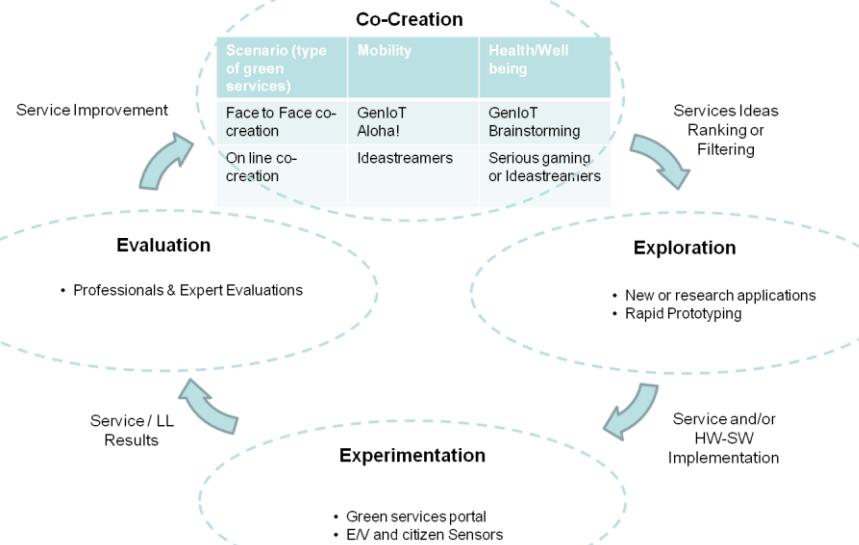

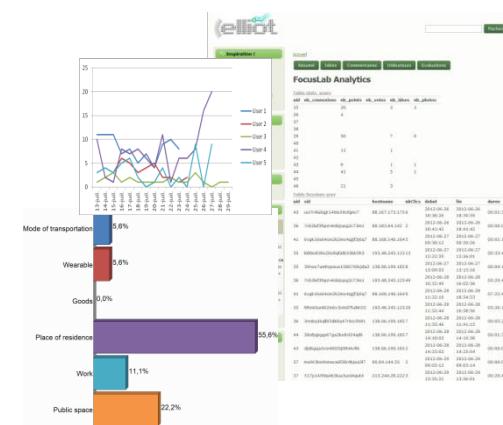

Social

- Generate enthusiasm for IoT based services
- Improve interest for air quality measurement
- Provide trustful services
- Foster citizen involvement in air quality measurement
- Encourage collaborative tagging and information sharing

Business

- Provide robust, relevant and customised environmental information
- Provide easy to use and engaging green services
- Change citizen behaviour towards a more sustainable lifestyle
- Respect citizen privacy and confidentiality

B.3 Co-création - Exploration : scénario Santé & Bien-être

Génération d'idées
Forums + Gamification

Storysteling

Smart object
& service design

The collage includes:

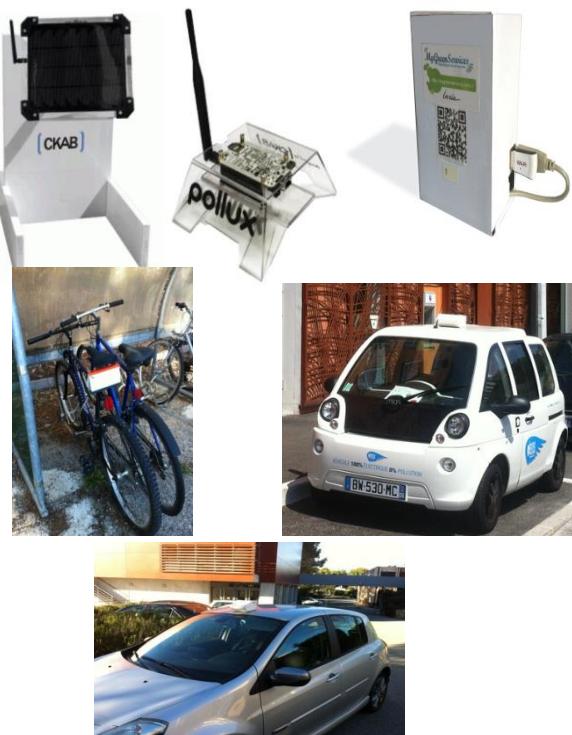

- Aloha! Toolkit:** A collection of printed cards and a circular diagram labeled "Scenario" and "User".
- Interactive Whiteboard:** Two people standing in front of a whiteboard displaying a 3D architectural rendering of a room.
- Smart Object:** A view from a balcony showing three small, colorful objects (blue, yellow, green) placed on a ledge.
- Elliot Platform:** A screenshot of a digital platform showing user profiles and activity feeds.
- Storyboarding:** A film strip showing four frames of a character interacting with a virtual environment, with speech bubbles containing text like "Oui, venez, je vais insérer la carte dans mon ordinateur pour vous faire un suivi avec vous j'ai porté GIE intelligent avec moi" and "ZIP!".
- Smart Object:** A character holding a red heart-shaped device with a screen and buttons, with a speech bubble about posting a measurement on Facebook.
- Smart Object:** A character walking down a city street.
- Physical Prototyping:** Hands working on a physical model of a small device.
- Workshop:** People sitting around a table in an office setting, engaged in discussion.
- Stakeholder Mapping:** A hand-drawn circular diagram titled "Stakeholder mapping" with various names and roles listed around the perimeter.

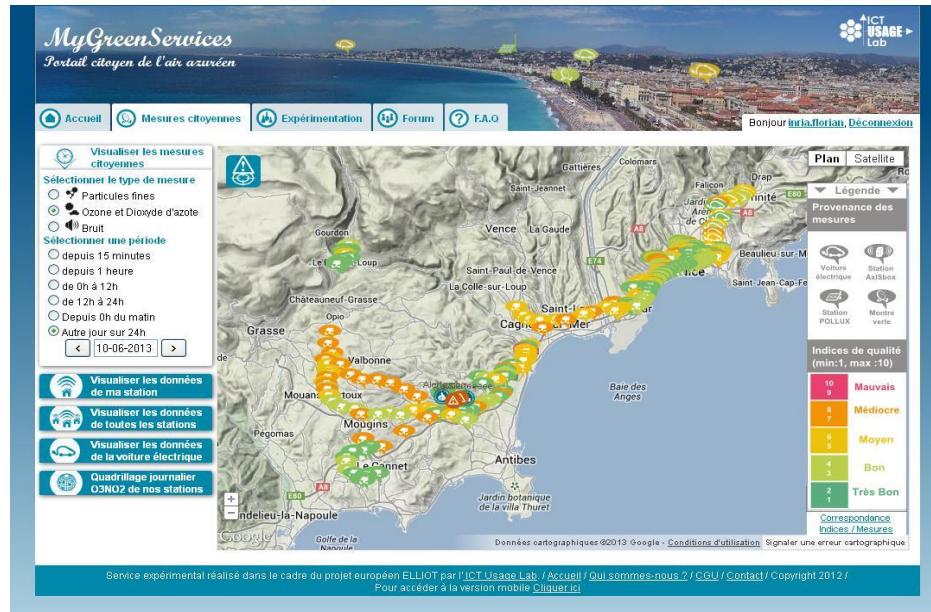

B.4 Implémentation Evaluation

Capteurs citoyens
et voiture MIA équipée de Nice

7 Prix « Smart Citizen »,
Innovative City 2013, Nice

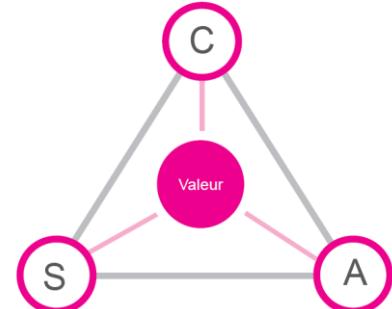

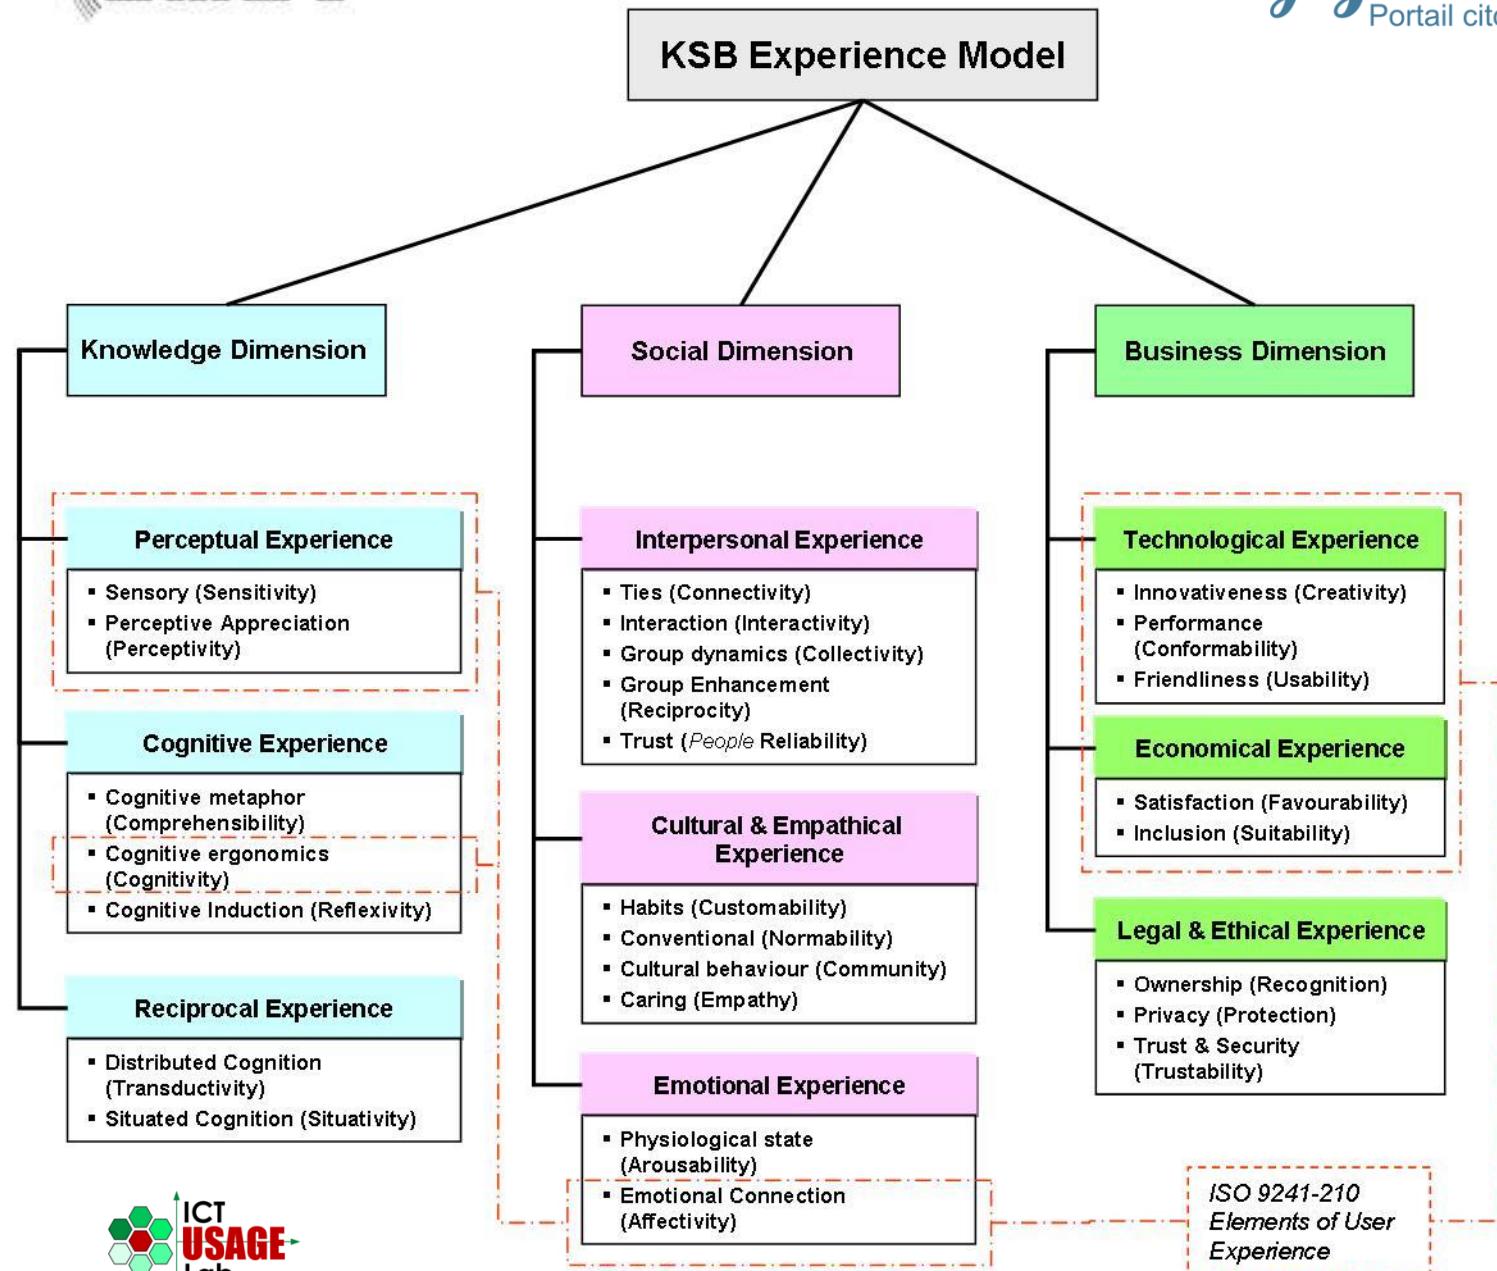

Figure 6. Modèle de création de valeur C-S-A

Step 1: Instantiating KSB model

Step 2: Defining relevant heterogeneous data

:

- Qualitative: Questionnaires (4 types), interview(1),
- Quantitative (4 types): Logs of *MyGreenServices* (2x16 days), Logs from gamified forum (2x16 days), Contents of the forum, IoT data (more than 4 millions of measures)

Step 3: Defining the rules

Step 4: Collecting during the experiment and Pre-processing data inside the living Lab, mainly with **FocusLab server**
With the objective to study ithe relevant of its generic IoT dedicated methods (D4.3.3 8).

| Ref | KSB Properties | Input | Indicators with weighting | |
|-----------|-------------------|--------------------------------|---|---|
| | | | | |
| Knowledge | K2.2 | Sensing affordances | Questionnaires (profiling and Q4) | Air quality knowledge |
| | K3.2 | Cognitive artefact | Questionnaire (Q4), Log, Interview | Environment evaluation (0.2), Change in activity (0.4), IoT Data comparison (0.4) |
| Social | S1.1 | Social Networking and openness | Questionnaire (Q2), Log | Level of activity, Frequency of connections, Forum statistics |
| | S2.1 | Communication | Interview | Number of MGS demonstrations |
| | S5.1 | Attractiveness | Questionnaire (Q4), Log | Number of intended recommendations, Number of effective recommendations, Frequency of connections after experiments |
| Business | B2.1 | Reliability | Questionnaire (Q2), Log | Perceived data reliability, Frequency of connections |
| | B3.1 | Ergonomic quality | Questionnaires (Q2, Q1.1 and Q1.2), Log | General findability Forum findability (0.5), Opinion alert service (0.25), Intuitivity of alert service (0.25) |
| | B4.1 | Usefulness | Questionnaire (Q1.2), Log, Interview | Alert programmation, Change in habits, Alert logs |
| | B4.2 | Hedonic quality | Questionnaires (Q1.1, Q1.2 and Q2) | Opinion MGS (0.5), Reaction to alert service (0.25), Opinion forum (0.25) |
| | B4.5 | Loyalty | Questionnaires (Q4 and Q1.1), Log | Intention of use, Frequency of connections (perceived), data logs connections and users sessions |
| | B6.1 | User ideas | Interview, Log | Number of new services, Forum statistics |
| | B7.1 | Data protection | Questionnaire (Q4) | Data protection (perceived) |

New model
12 KSB properties

Use of 3 types
of UX:

- Momentary UX (aleatory)
- Episodic UX (4 sessions)
- Cumulative UX (2 times)

B.7 Exemples de règles

S1.1 Social Networking and openness = high (expe1)

If %users inactive > **90%** then S1.1= low

If %users proactive > **2%** then S1.1 = high

S1.1 = Medium for the rest

Thresholds: common rule

Questionnaire Q2 ([did MGS encourage you to participate and share knowledge?](#))

And logs (frequency of connexions, statistics from the forum)

B7.1 Data protection : high

To compute this property, we use two indirect questions:

Q4/Q14: do you feel that your personal data are protected by *MyGreenServices*

Q15: please specify

B.7 Exemples de résultats

S5.1 Attractiveness: High (expe 1)

To compute this property, we use the user answers to two indirect questions (Q7, Q9) from questionnaire Q4.

- **Q4/Q7: Would you recommend the portal to your friends?**
- **Q4/Q9: Have you recommended MyGreenServices to your friends / acquaintances?**

| | Q7 Yes | Q7 No |
|--------|--------|--------|
| Q9 Yes | 77,80% | 0 |
| Q9 No | 22,20% | 0 |
| | high | medium |
| | medium | Low |

B.7 (suite) Exemples de résultats

KBS Results Experiment 2

Improvement of mainly 3 KSB properties (already high)

B2.1 Reliability

judgement of IoT data (100% instead of 75%)

S1.1 Social networking and Openness

(57% instead of 50%)

B7.1 Data protection high as in expe 1

B.8 Lessons Learnt

Success factors

- Participants were aware of air quality awareness. The awareness can be considered as a first step in the **behavior changing process**.
- Elaboration of a **community of 50 active contributors** (citizen/ professionals, co-creators/data producers). 3 serious games, Importance of community management
- UX Improvement of the second version *MyGreenServices* based on user feedback which is very helpful
- Deployment of a complete living lab process involving citizen and applying Ksb model to measure experience at each step based on both qualitative and quantitative data
- Environmental sensors/devices

Challenges

- New smart low cost environmental sensors and devices
- More studies for UX measurement supports towards more advanced KPIs linked to advanced data analysis methods and linked to user IoT contexts
- Make sustainable such a open data portal: experiments on new economic models with more sensors and more citizen-

Abstract

This paper describes an Open Innovation case study within the European project ELLIOT - Experiential Living Lab for Internet of Things (IoT). In this context, our lab aimed at co-creating green services with a set of stakeholders on air quality and noise measurement on Nice Côte d'Azur (NCA) territory via citizen sensing. Our objectives dedicated to Transport and Health scenarios are:

- Raising public awareness by involving citizens in collecting environmental data and creating a community of empowered citizens;
- Providing solutions that can reduce the environmental impact;
- Alerting the community in case of exceeding the thresholds recommended by the EU.

After introducing the context and the problem, we will first present the main related concepts and works before starting the ELLIOT project. Then, we present our approach for co-creating with citizen environmental IoT-based services, which is based on an Experiential Design (XD) process, a new Ideation methodology dedicated to IoT and finally our User Experience (UX) model and measurement methodology related to MyGreenServices portal we implemented. Before concluding about MyGreenServices in order to make it sustainable on the chosen Territory, we describe the main outcomes of this pilot, both issued from the XD process as well as the UX measurement.

Introduction

This paper describes an Open innovation case study managed by the Axis team from Inria (<http://www-sop.inria.fr/axis/>) within the ICT Usage Lab (labelled by ENOLL in 2006 and located in the South-East of France) applied to the co-creation of IoT-based green services (in our green use case, air quality and/or noise) within the European FP7 IoT project named ELLIOT - Experiential Living Lab for Internet of Things (www.elliot2project.eu).
