I. General Principle

In this tool textures will be represented as *planar maps*. A planar map is a set of curves whose intersections and enclosed faces are computed. Therefore, you can manipulate three kinds of *cells* in the planar map: *vertices, edges* and *faces*. Each of these cells knows all of its neighbors, also called *incident cells*.

All textures begin with a *partition*, then they are refined using *mappers*. When two textures are created this way, they can be *combined*:

II. Partitions

Partitions act as construction lines which define the broad-scale organization of the texture. You can choose between four starting partitions:

---
2 regular ones (stripes, grid)
2 irregular ones (uniform, random)
---

Partitions are cut at the border of the domain using a border management option (see Appendix 2). You will be able to manipulate the cells of partitions using mappers.
Practice: execute partitions scripts and modify their parameters

```python
def test_StripesPartition():
    lines1 = StripesProperties(-pi/3.0, 110)
    part = StripesPartition(lines1)
    ExportSVG(part, 2000)
def test_GridPartition():
    lines1 = StripesProperties(pi/6.0, 110)
    lines2 = StripesProperties(pi/2.0 + pi/3.0, 200)
    part = GridPartition(lines1, lines2, CROP_ADD_BOUNDARY)
    ExportSVG(part, 2000)
def test_UniformPartition():
    props = IrregularProperties(1/22000)
    part = UniformPartition(props, CROP_ADD_BOUNDARY)
    ExportSVG(part, 2000)
def test_RandomPartition():
    props = IrregularProperties(1/22000)
    part = RandomPartition(props, CROP_ADD_BOUNDARY)
    ExportSVG(part, 2000)
```

III. Mappers

Mappers are the operators that give you the most freedom in this tool. Actually you write yourself your mappers so that they do exactly what you want them to do. In practice, a mapper is a kernel function that draws a new element from one cell of the planar map. For instance, the following mapper is a function that draws a randomly-rotated blob shape on a given face:

```python
def K(face):
    new_blob = Rotate(blob, Random(face, 0, 2*pi, 0))
    return MatchPoint(new_blob, BBoxCenter(new_blob), Centroid(face))
```

Once you wrote the mapper, you have to wrap it inside a mapping operator which applies your mapper on every cell of the planar map. Here, this mapping operator is “MapToFaces” because the mapper deals with faces. There are also a “MapToEdges” and a “MapToVertices” for the two other kinds of cells. This mapping operator ensures that your mapper has an homogeneous effect all over the texture, thus preserving a repetitive, predictable look.

You can write almost anything inside a mapper. At the end of this document there is an API of built-in functions you can use, but you can develop your own. All you have to do is observing the three following rules:

—Always stay in a bounded neighborhood around the current cell. For instance, you must not use neighborhood functions for writing a loop that travels along the texture until reaching the border. This would yield non-homogeneous effects and unwanted artifacts.

—Do not modify global variables in your mapper. If global variables change at each execution of your mapper, then the mapping operator will not be able to apply it with a homogeneous effect.

—Do not use global, hard-coded coordinates. For example if your mapper depends on the position (255, 42) then it will never have a homogeneous effect all over the texture.

In practice, mappers can be used for modifying both geometry and connections, for randomizing the texture, etc. See the examples for more info.
IV. Combining Textures

There are two ways of combining textures. The first one is to call the code of one of the textures in a mapper:

```python
def test_Overview():
    size = 2000
    blob = Scale(ImportSVG("data/blob.svg"), 0.6)
    zig = ImportSVG("data/zig.svg")

    # Mapper: place a blob in each face
    def map_blob_to(face):
        new_blob = Rotate(blob, Random(face, 0, 2*pi, 0))
        return MatchPoint(new_blob, BBoxCenter(new_blob), Centroid(face))

    # Mapper: replace each edge by a curved line
    def map_curve_to(edge):
        if IsBoundary(edge):
            return ToCurve(edge)
        src_c = PointLabeled(zig, "start")
        dst_c = PointLabeled(zig, "end")
        src_v = Location(SourceVertex(edge))
        dst_v = Location(TargetVertex(edge))
        return MatchPoints(zig, src_c, dst_c, src_v, dst_v)

    # Mapper: generate a texture in each face
    def map_texture_to(face):
        # Grid partition with randomized orientations
        theta = Random(face, 0, 2*pi, 1)
        width = BBoxWidth(face)/5
        lines1 = StripesProperties(theta, width)
        lines2 = StripesProperties(theta+pi/2, width)
        init_tex = GridPartition(lines1, lines2, CROP_ADD_BOUNDARY)

        # Mapping operator
        texture2 = MapToEdges(map_curve_to, init_tex)
        return texture2(face)

        # Uniform partition
        props = IrregularProperties(10/(size*size))
        init_tex = UniformPartition(props, KEEP_OUTSIDE)

        # Mapping operators
        blob_tex = MapToFaces(map_blob_to, init_tex)
        final_tex = MapToFaces(map_texture_to, blob_tex)

        # Export final texture
        ExportSVG(final_tex, size)
```

ACM Transactions on Graphics, Vol. VV, No. N, Article XXX, Publication date: Month YYYY.
You can also combine two textures using either Union, Inside or Outside:

\[
\begin{array}{ccc}
T1 & T2 & T3 \\
\text{Union}(T1, T2) & \text{Inside}(T2, T1) & \text{Outside}(T3, T1)
\end{array}
\]
V. Labels

You can add additional information to the planar map’s cells. In particular you can add labels, which can then be used in mappers for varying effects.

In StripesPartition labels are defined periodically: “Red, blue, red, blue, ...” for instance. It is the same in GridPartition, except with two dimensions. For UniformPartition and RandomPartition, the labels are added randomly. You can specify the chances of each label appearing.

Labels can be used everytime you want to make your mappers’ behavior variable. Here is an example with periodic refinement of the texture’s topology:

```python
def brickwall():
    size = 2000

    # Grid partition, including edge labels
    lines1 = StripesProperties(0.0, size/16)
    lines2 = StripesProperties(pi/2.0, size/16)
    SetEdgeLabels(lines1, "h1", "h2")
    SetEdgeLabels(lines2, "v1", "v2")
    grid_text = GridPartition(lines1, lines2, KEEP_OUTSIDE)

    # Mapper: remove edges
    def grid_to_wall(edge):
        if (HasLabel(edge, "v1") and HasLabel(IncidentEdges(TargetVertex(edge)), "h1") or
            (HasLabel(edge, "v2") and HasLabel(IncidentEdges(TargetVertex(edge)), "h2"))):
            return Nothing()
        return ToCurve(edge)

    # Mapping operator
    wall_text = MapToEdges(grid_to_wall, grid_text)

    # Final texture
    ExportSVG(wall_text, size)
```
VI. Sandbox

Let’s plug the components in the sandbox script (Appendix III) together so as to make the two following textures:

Appendix I. API

<table>
<thead>
<tr>
<th>Partition operators</th>
<th>Regular partitions</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>
### Mappers built-in operators

<table>
<thead>
<tr>
<th>Incidence</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IncidentFaces</td>
<td>Faces connected to v</td>
</tr>
<tr>
<td>IncidentEdges</td>
<td>Edges connected to c</td>
</tr>
<tr>
<td>IncidentVertices</td>
<td>Vertices connected to f</td>
</tr>
<tr>
<td>SourceVertex</td>
<td>Source vertex connected to e</td>
</tr>
<tr>
<td>TargetVertex</td>
<td>Target vertex connected to e</td>
</tr>
<tr>
<td>LeftFace</td>
<td>Left face connected to e</td>
</tr>
<tr>
<td>RightFace</td>
<td>Right face connected to e</td>
</tr>
</tbody>
</table>

### Adjacency

<table>
<thead>
<tr>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>MatchPoint</td>
<td>Translates curves in the direction ( t - s )</td>
</tr>
<tr>
<td>MatchPoints</td>
<td>Applies the rigid transformation ( { s_1, s_2 } \rightarrow { t_1, t_2 } ) to ( c )</td>
</tr>
<tr>
<td>MatchFace</td>
<td>Scales and Translates ( c ) in ( f )</td>
</tr>
</tbody>
</table>

### Geometry

<table>
<thead>
<tr>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Location</td>
<td>Position of vertex ( v )</td>
</tr>
<tr>
<td>LocationAt</td>
<td>Position on ( e ), according to ( s \in [0, 1] )</td>
</tr>
<tr>
<td>Centroid</td>
<td>Centroid position of face ( f )</td>
</tr>
<tr>
<td>Contour</td>
<td>Boundary of face ( f )</td>
</tr>
<tr>
<td>ToCurve</td>
<td>Transforms edge ( e ) into a curve</td>
</tr>
</tbody>
</table>

### Labels

<table>
<thead>
<tr>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>HasLabel</td>
<td>Tests if cell(s) ( c ) contain the label ( l )</td>
</tr>
<tr>
<td>IsBoundary</td>
<td>Tests if ( c ) is adjacent to the unbounded face</td>
</tr>
<tr>
<td>PointLabeled</td>
<td>Returns the location in ( c ) labelled by ( l )</td>
</tr>
<tr>
<td>CurveLabeled</td>
<td>Returns the curve ( c ) labelled by ( l )</td>
</tr>
</tbody>
</table>

### Random values

<table>
<thead>
<tr>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Random ( x \in [m, n] )</td>
<td>Random value ( x \in [m, n] )</td>
</tr>
<tr>
<td>Random</td>
<td>Deterministic random value. This function always returns the same value for a given ( c ) and scalar ( n )</td>
</tr>
</tbody>
</table>

### Merging operators

<table>
<thead>
<tr>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Union</td>
<td>All the curves from ( A_1 ) and ( A_2 )</td>
</tr>
<tr>
<td>Inside</td>
<td>Edges of ( A_1 ) inside ( A_2 )’s faces</td>
</tr>
<tr>
<td>Border</td>
<td>Edges of ( A_1 ) outside ( A_2 )’s faces</td>
</tr>
</tbody>
</table>

### Useful functions available in our scripts

<table>
<thead>
<tr>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>ImportSVG</td>
<td>Loads curves from the given SVG file</td>
</tr>
<tr>
<td>ExportSVG</td>
<td>Exports ( A ) in SVG</td>
</tr>
<tr>
<td>BBoxWidth</td>
<td>Bounding box width of an element ( c )</td>
</tr>
<tr>
<td>BBoxHeight</td>
<td>Bounding box height of an element ( c )</td>
</tr>
<tr>
<td>BBoxCenter</td>
<td>Bounding box center of an element ( c )</td>
</tr>
<tr>
<td>Scale</td>
<td>Scales ( c ) by a factor ( s )</td>
</tr>
<tr>
<td>Rotate</td>
<td>Rotates ( c ) by a factor ( s \in [0, 2\pi] )</td>
</tr>
<tr>
<td>Translate</td>
<td>Translates ( c ) in the direction ( v )</td>
</tr>
<tr>
<td>Nothing()</td>
<td>Returns an empty set of curves</td>
</tr>
</tbody>
</table>
