## Graph Signal Processing

#### Structured datasets:

- Interacting entities (graph)
- Data carried by entities (graph signal)

Source: Wikimedia.org

### Signal processing on graphs:

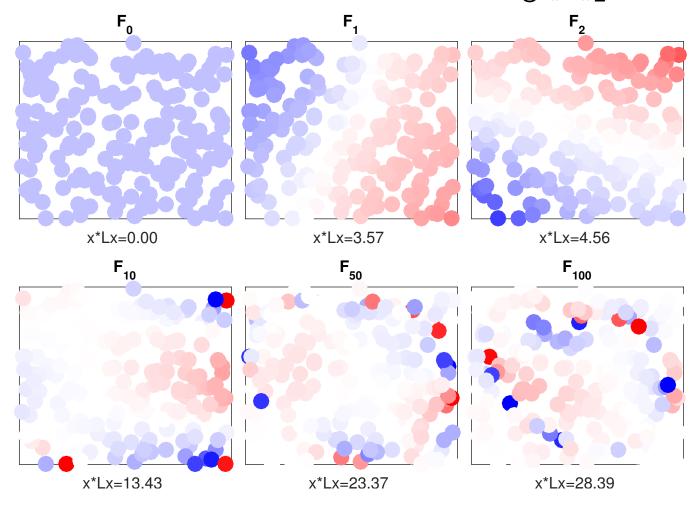

Processing data considering a given underlying structure on data points.

### Graph Fourier Transform and Signal Smoothness

Background

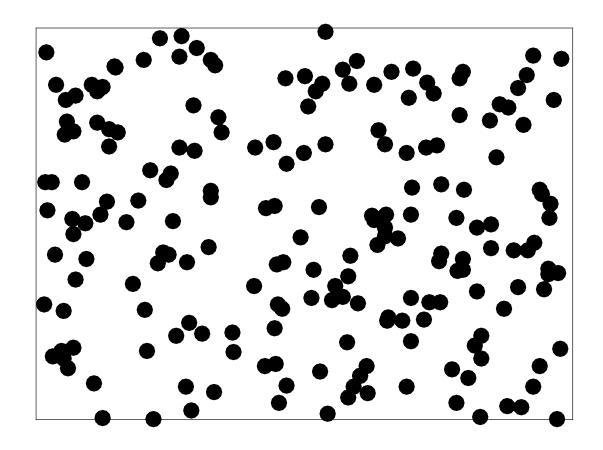

Graph signal variation:  $||x||_L = x^* Lx = \sum_{ij} w_{ij} |x_i - x_j|^2$  (L = D - W).

Graph Fourier modes: Orthonormal basis minimizing  $||x||_L \Rightarrow L = F^* \Lambda F$ 

### Sampling of a Euclidean Space

### 2D Example:

## Choosing a Graph: Weights

Conventional approach: Gaussian weights

Background

$$w_{ij} = \exp\left(-\frac{\|x_i - x_j\|^2}{2\sigma^2}\right)$$

Guarantee (Belkin & Niyogi, JCSS '08): For a given continuous signal  $\tilde{s}$ , its sampling  $s^{(N)}$  on the graph  $\mathcal{G}^{(N)}$  verifies:

$$L^{(N)}s^{(N)} \xrightarrow[N\to\infty]{} \Delta\widetilde{s}$$

Question: How do the continuous and graph Fourier transforms relate?

- Sampled continuous mode ≠ graph mode
- continuous spectrum VS graph spectrum?

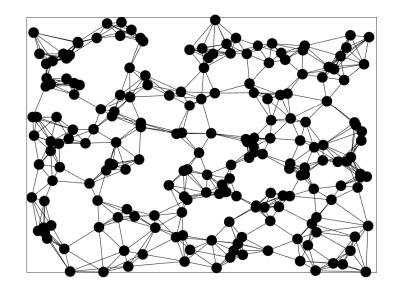

**Additional Question:** How do we choose  $\sigma$ ?

## Choosing a Graph: Sparsity

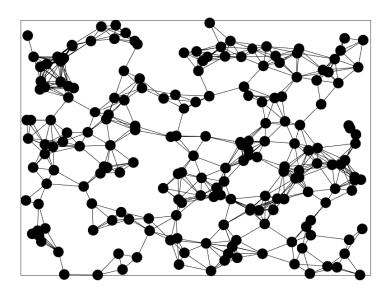

GSP algorithms: better complexity for sparse graphs.

Background

K-Nearest Neighbors (KNN)

#### Distance Threshold (THR)

### Stochastic Graph Signal Model: Stationarity

Background

Statistical invariance through Graph Translation.<sup>1</sup>

### Definition (Wide Sense Stationary (WSS))

$$\mu_{i} := \mathbb{E}[\mathbf{s}_{i}] = \mathbb{E}[(T_{\mathscr{G}}\mathbf{s})_{i}] \qquad \forall i \in V \qquad (1^{\text{st moment}})$$

$$R_{ij} := \mathbb{E}[\mathbf{s}_{i}\mathbf{s}_{j}^{*}] = \mathbb{E}[(T_{\mathscr{G}}\mathbf{s})_{i}(T_{\mathscr{G}}\mathbf{s})_{j}^{*}] \qquad \forall i, j \in V \qquad (2^{\text{nd moment}})$$

#### **Theorem**

s is graph Wide Sense Stationary iff

• 
$$\mathbb{E}[\widehat{\mathbf{s}}(I)] = 0$$
 if  $I \neq 0$ ,

•  $S := \mathbb{E}[\widehat{\mathbf{s}}\widehat{\mathbf{s}}^*]$  is diagonal.

### Graph Fourier Modes Properties

Our goal: Continuous stationarity ⇒ Graph stationarity

Background

- Uncorrelated continuous frequencies ⇒ Uncorrelated graph frequencies
- Continuous PSD ⇒ Graph PSD

### A Data Driven Approach to Choosing a Graph

Background

#### Our Approach:

- 1 Consider a continuous stationary signal:  $\tilde{s}$
- 2 Sample it: s
- 3 Compute its covariance:  $\Sigma_s$
- Learn<sup>2</sup> the Laplacian the closest to the precision matrix  $\Sigma_{\mathbf{s}}^{-1}$

Additional Step: Add connectivity constraints (KNN or THR).

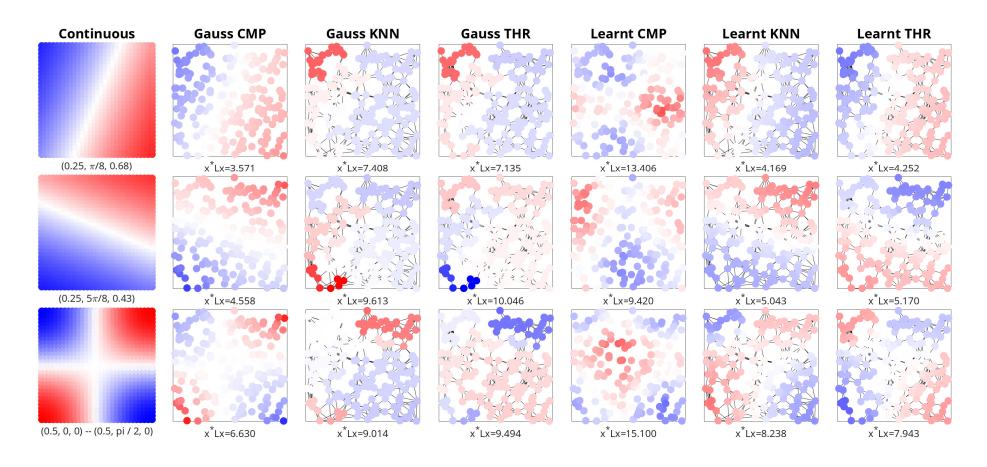

**Underlying graph model**: stationarity with graph PSD  $1/\lambda$ 

IEEE Transactions on Signal Processing, 2017

<sup>&</sup>lt;sup>2</sup>Hilmi E. Egilmez, Eduardo Pavez, and Antonio Ortega. Graph Learning from Data under Laplacian and Structural Constraints.

 $\tilde{\mathbf{s}}$ : a continuous WSS signal with PSD  $1/v^2$  (GRF model).

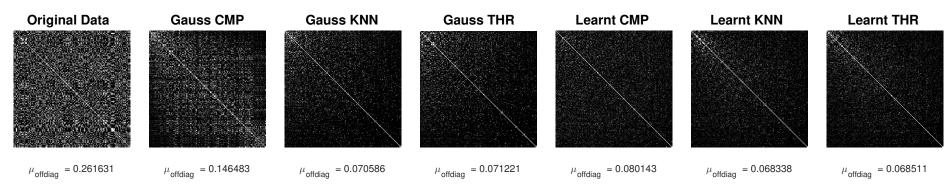

**Goal:** s is graph WSS of graph PSD  $1/\lambda$ .

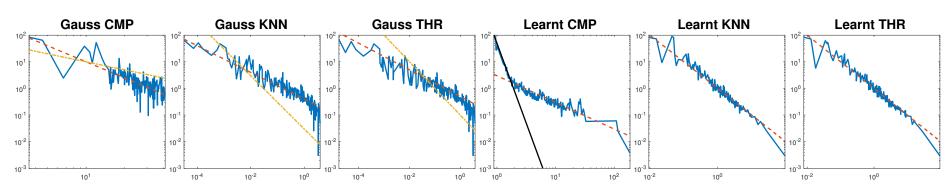

### Synthetic Sensor Network: Spectral Domain

Background

#### **Spectral Pearson Correlations:**

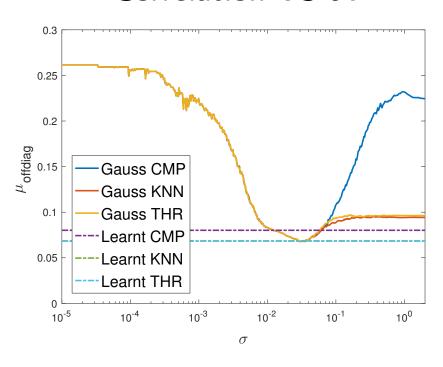

#### **Graph Power Spectrum:**

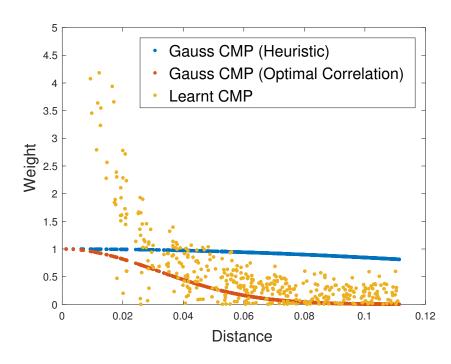

### Synthetic Sensor Network: $\sigma$

Background

#### Correlation VS $\sigma$ :

### Weight VS Distance:

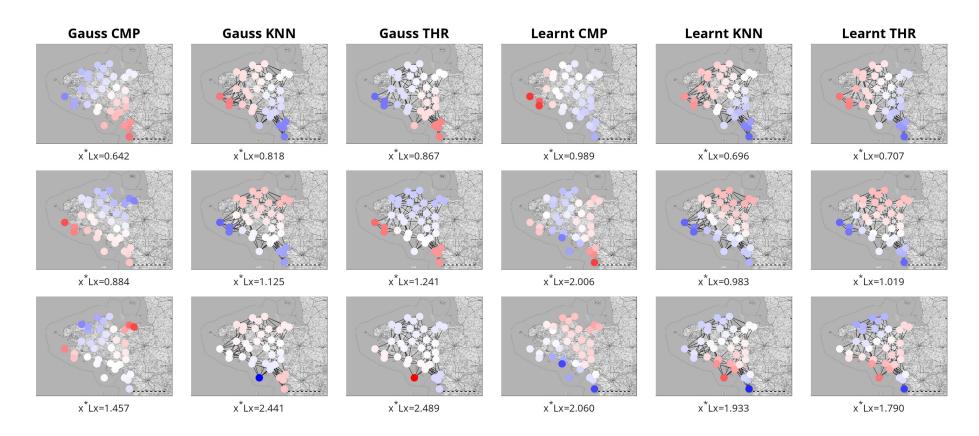

**Experiments** 

### Temperature Data

 $\tilde{\mathbf{s}}$  are temperature increments over time.

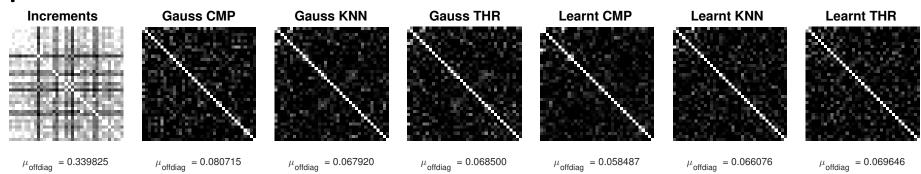

Challenge: Does not depend only on the distance.

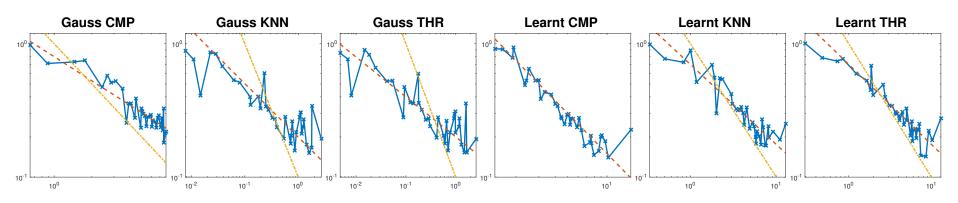

### Temperature Data: Spectral Domain

Background

#### **Spectral Pearson Correlations:**

#### **Graph Power Spectrum:**

### Summary and Perspectives

### Summary on Learning a Graph VS Gaussian Weights

Background

- Less spectral correlations
- Better power spectrum
- Sparsity

#### Perspectives

- Formal proof?
- More complex signals?
