# HAL Id: hal-01657144 https://inria.hal.science/hal-01657144v1

Submitted on 6 Dec 2017

**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers. L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

## Data Discovery in RDF Graphs

DEXA Conference, Aug 29, 2017

### Outline

- Background: semantic RDF graphs
- Summarizing semantic-rich RDF graphs [ČGM15a, ČGM15b, ČGM17a]
  - Joint work with Šejla Čebirić (Inria) and François Goasdoué (U. Rennes 1 and Inria)
- Finding insights in RDF graphs [DMS17]
  - Joint work with Yanlei Diao and Shu Shang (Ecole Polytechnique and Inria)

Part I

# Background: RDF graphs

Ioana Manolescu

#### Big Data needs semantics

AI Magazine, Spring 2015

Ioana Manolescu

Discovering RDF Graphs

#### Do we really need the semantics?

#### Yes. All the time.

#### Application knowledge / constraints:

- Every Senator is an ElectedOfficial which is a Person
- (On Wikipedia) being BornInAPlace means being a Person

#### Do we really need the semantics?

#### Yes. All the time.

#### Application knowledge / constraints:

- Every Senator is an ElectedOfficial which is a Person
- (On Wikipedia) being BornInAPlace means being a Person

#### Without the semantics, we may miss query answers

Data	Constraints	Query
John is a <u>Senator</u>	Every Senator is a Person	Who is a <u>Person</u> ?

#### Do we really need the semantics?

#### Yes. All the time.

#### Application knowledge / constraints:

- Every Senator is an ElectedOfficial which is a Person
- (On Wikipedia) being BornInAPlace means being a Person

#### Semantic contraints are a **compact** way of encoding information

"Every  $\underline{\text{ElectedOfficial}}$  is a  $\underline{\text{Person}}$ " stated only once even if thousands of  $\underline{\text{ElectedOfficials}}$ .

#### Semantics for Web data

Data and metadata on the Web is often structured in graphs, e.g., **RDF** (W3C's Resource Description Framework)

RDF

• Famous application: the Linked Open Data cloud (2017)

### The Resource Description Framework (RDF)

#### RDF graph: set of triples

Assertion	Triple	Relational notation	Intuition
Class	s rdf:type o	o(s)	"s is an o"
Property	spo	p(s,o)	"The p of s is o"

## The Resource Description Framework (RDF)

#### RDF graph: set of triples

Assertion	Triple	Relational notation	Intuition
Class	s rdf:type o	o(s)	"s is an o"
Property	spo	p(s, o)	"The p of s is o"

## The Resource Description Framework (RDF)

Assertion	Triple	Relational notation	Intuition
Class	s rdf:type o	o(s)	"s is an o"
Property	spo	p(s, o)	"The p of s is o"

## The Resource Description Framework (RDF)

Assertion	Triple	Relational notation	Intuition
Class	s rdf:type o	o(s)	"s is an o"
Property	spo	p(s, o)	"The p of s is o"

## RDF Schema (RDFS)

#### Declare deductive constraints between classes and properties

Constraint	Triple	OWA interpretation
Subclass	$c_1$ rdfs:subClassOf $c_2$	$c_1\subseteqc_2$
Subproperty	$p_1 \ \mathrm{rdfs:subPropertyOf} \ p_2$	$\mathtt{p}_1\subseteq \mathtt{p}_2$
Domain typing	p rdfs:domain c	${\sf \Pi}_{ m domain}({\tt p})\subseteq{\tt c}$
Range typing	p rdfs:range c	${\sf \Pi}_{ m range}({\tt p})\subseteq{\tt c}$

RDF RDFS

## RDF Schema (RDFS)

#### Declare deductive constraints between classes and properties

Constraint	Triple	OWA interpretation
Subclass	$c_1$ rdfs:subClassOf $c_2$	$c_1 \subseteq c_2$
Subproperty	$p_1 \ \mathrm{rdfs:subPropertyOf} \ p_2$	$\mathtt{p}_1\subseteq \mathtt{p}_2$
Domain typing	p rdfs:domain c	${\sf \Pi}_{ m domain}({\tt p})\subseteq{\tt c}$
Range typing	p rdfs:range c	${\sf \Pi}_{ m range}({\tt p})\subseteq{\tt c}$

## RDF Schema (RDFS)

#### Declare deductive constraints between classes and properties

Constraint	Triple	OWA interpretation
Subclass	$c_1$ rdfs:subClassOf $c_2$	$c_1 \subseteq c_2$
Subproperty	$p_1 \ \mathrm{rdfs:subPropertyOf} \ p_2$	$\mathtt{p}_1\subseteq \mathtt{p}_2$
Domain typing	p rdfs:domain c	$\Pi_{ ext{domain}}(\mathtt{p})\subseteq \mathtt{c}$
Range typing	p rdfs:range c	${\sf \Pi}_{ m range}({\tt p})\subseteq{\tt c}$

#### "Anyone having p is a c"

RDF RDFS

## RDF Schema (RDFS)

#### Declare deductive constraints between classes and properties

Constraint	Triple	OWA interpretation
Subclass	$c_1$ rdfs:subClassOf $c_2$	$c_1 \subseteq c_2$
Subproperty	$p_1 \ \mathrm{rdfs:subPropertyOf} \ p_2$	$\mathtt{p}_1\subseteq \mathtt{p}_2$
Domain typing	p rdfs:domain c	${\sf \Pi}_{ m domain}({\tt p})\subseteq{\tt c}$
Range typing	p rdfs:range c	${\sf \Pi}_{ m range}({\tt p})\subseteq{\tt c}$

"Anyone who is a value of p is a c"

### Open-world assumption and RDF entailment

RDF data model based on the open-world assumption.

Deductive constraints lead to **implicit triples**: part of the graph even though not explicitly present

### Open-world assumption and RDF entailment

RDF data model based on the open-world assumption.

Deductive constraints lead to **implicit triples**: part of the graph even though not explicitly present

## Open-world assumption and RDF entailment

RDF data model based on the open-world assumption.

Deductive constraints lead to **implicit triples**: part of the graph even though not explicitly present

explicit triples		
+	$\rightarrow$	implicit triples
entailment rules		

Exhaustive application of entailment leads to saturation (closure)

#### The semantics of an RDF graph G is its saturation $G^{\infty}$

Sample instance entailment rules from schema and instance triples

 $\mathtt{c_1} \ \mathrm{rdfs:subClassOf} \ \mathtt{c_2} \ \land \ \mathtt{s} \ \mathrm{rdf:type} \ \mathtt{c_1} \vdash_{\mathtt{RDF}} \mathtt{s} \ \mathrm{rdf:type} \ \mathtt{c_2}$ 

- $p_1 \; \mathrm{rdfs:subPropertyOf} \; p_2 \; \land \; \texttt{s} \; p_1 \; \texttt{o} \vdash_{\mathrm{RDF}} \texttt{s} \; p_2 \; \texttt{o}$
- p rdfs:domain c  $\land$  s p o  $\vdash_{RDF}$  s rdf:type c

p rdfs:range c  $\,\wedge\,$  s p o  $\vdash_{\rm RDF}$  o rdf:type c

### RDF graph discovery

An RDF graph can be large and complex, lack a fixed schema, include many heterogeneous values...

16 / 54

### RDF graph discovery

An RDF graph can be large and complex, lack a fixed schema, include many heterogeneous values...

## RDF graph discovery

Two approaches:

- RDF summarization: compactly representing the explicit and implicit structure of a graph
- Insight discovery in RDF graphs: automatically identify aggregation queries with interesting results

# Part II

# **RDF** summarization

#### **RDF** summaries

#### Problem

RDF graph G is large, heterogeneous, partially implicit. How to compactly represent all its structure?

#### Existing solutions

Partial representation (frequent patterns, statistics etc.)
e.g., [NM11, LYL13]
Potentially not compact e.g., [GW97, CFKP15]
Only for explicit data, e.g., [CDT13, ZDYZ14]

## A summary of DBLP data

#### 150M triples

#### A summary of geographic data

French territory division in regions, departments, urban areas, cities, districts etc. 368K triples

Dataset: http://insee-geo.fr. Number of triples: 368417 Nodes: 30 (Typed: 9, Untyped: 21, Property: 0) Edges: 69 (Data edges: 69, Schema edges: 0)

### **RDF** summaries

#### We define

- ORDF node equivalence relation ≡: equivalence relation such that class and property nodes are only equivalent to themselves
- ② RDF summary G<sub>/=</sub> of an RDF graph G: the quotient of G through =

Recall: quotient of a directed graph G by  $\equiv$ 

- G = (V, E),  $\equiv$  equivalence relation on V
  - $G_{/\equiv}$  nodes: one for  $\equiv$  equivalence class of V
  - $G_{/\equiv}$  edges:  $n_{\equiv}^1 \xrightarrow{a} n_{\equiv}^2$  iff  $\exists n_1 \xrightarrow{a} n_2 \in G$  such that  $n_1$  represented by  $n_{/\equiv}^1$ ,  $n_2$  represented by  $n_{/\equiv}^2$

Why not use any node equivalence? E.g., forward and backward bisimilarity  $\sim_{\tt fb} [\rm HHK95]$ 

Why not use any node equivalence? E.g., forward and backward bisimilarity  $\sim_{\tt fb}$  [HHK95]

Sample graph G and its quotient through  $\sim_{\mathtt{fb}}$ 

Why not use any node equivalence? E.g., forward and backward bisimilarity  $\sim_{\tt fb}$  [HHK95]

Sample graph G and its quotient through  $\sim_{\mathtt{fb}}$ 

Loss of class and (some) property names

Why not use any graph node equivalence? E.g., forward and backward bisimilarity  $\sim_{\rm fb}$ 

Sample graph G and its quotient through  $\sim_{\mathtt{fb}}$ 

#### Loss of schema triples

Why not use any graph node equivalence? E.g., forward and backward bisimilarity  $\sim_{\rm fb}$ 

Sample graph G and its quotient through  $\sim_{\mathtt{fb}}$ 

Why not use any graph node equivalence? E.g., forward and backward bisimilarity  $\sim_{\rm fb}$ 

Sample graph G and its quotient through  $\sim_{\mathtt{fb}}$ 

#### Loss of implicit triples

Sample graph G and its quotient through  $\sim_{\mathtt{fb}}$ 

Quotient of the same graph through

the RDF node equivalence  $\equiv_{fb}$ 

### Formal summary properties

For any RDF equivalence relation  $\equiv$ :

Size limit	The summary is at most as large as the graph.		
Schema	The schema of $G_{/\equiv}$ is the schema of G.		
preservation			
Representativeness	Any conjunctive query q with answers on G also		
	has answers on its summary:		
	$q(\mathtt{G}^\infty) eq \emptyset \;\;\Rightarrow\;\; q((\mathtt{G}_{/\equiv})^\infty) eq \emptyset$		
	This enables query pruning (for query an-		
	swering) without saturating G		

#### Which equivalence relations to use?

#### Equivalence notions previously studied

- Forward / backward / forward and backward simulation
- Forward / backward / forward and backward bisimulation

Adapted to semantic RDF graphs

Novel equivalence notions we introduce (see next)

- Flexible similarity suited to heterogeneous graphs
- Based on property cliques and possibly on RDF types

#### RDF node equivalence based on property cliques

Intuition:  $a_1, a_2$  are similar;  $r_1, r_2, r_3, r_4, r_5$  are similar

#### RDF node equivalence based on property cliques

**Output property cliques:**  $\{a, t, e, c\}$ ;  $\{r\}$ ;  $\{p\}$ ;  $\emptyset$ **Input property cliques:**  $\{a\}$ ;  $\{t\}$ ;  $\{e\}$ ;  $\{c\}$ ;  $\{r, p\}$ ;  $\emptyset$ 

#### Weak clique-based summaries

Two nodes are weakly equivalent ( $\equiv_W$ ) iff they have the same input clique or the same output clique.

Weak summary  $G_{\equiv W}$  of the sample RDF graph G:

Property: In  $G_{\equiv W}$ , each data property appears exactly once  $\Rightarrow$  its nodes are "source of p, target of p" for each p [ČGM15b].

### Weak clique-based summaries

Property:  $G_{\equiv W}$  nodes are "source of p, target of p" for each p.

**Detecting errors in the data:** why do the birthplace and deathplace loop?

#### Looking in the data, we find:

 $\label{eq:linear} $$ $ \frac{\theta_{1,0}}{\theta_{1,0}} - \frac{\theta_{1,0}}{\theta_{1,0}}$ 

(http://dbpedia.org/resource/Kunitomo\_lkkansai) (http://dbpedia.org/ontology/birthPlace)
(http://dbpedia.org/resource/Kunitomo\_lkkansai) .

#### Strong clique-based summaries

Two nodes are strongly equivalent  $(\equiv_S)$  iff they have the same input clique and the same output clique.

Strong summary  ${\tt G}_{/\equiv\,{\rm S}}$  of the sample RDF graph G:

### Using types for summarization

Group nodes **first by their types**; then group untyped nodes by their property cliques.

Typed weak summary  ${\tt G}_{/\equiv\,\rm TW}$  of the sample RDF graph G:

35 / 54

### RDF summaries outline

Summary	Weak?	Strong?	Types first?
$G_{\equiv W}$	$\checkmark$		
G <sub>/=S</sub>		$\checkmark$	
$G_{\equiv TW}$	$\checkmark$		$\checkmark$
$G_{\equiv TS}$		$\checkmark$	$\checkmark$

### RDF summaries outline

Summary	Weak?	Strong?	FW bisim?	BW bisim?	Types first?
$G_{\equiv W}$	$\checkmark$				
G <sub>/=S</sub>		$\checkmark$			
$G_{\equiv TW}$	$\checkmark$				$\checkmark$
$G_{\equiv TS}$		$\checkmark$			$\checkmark$
$G_{/\equiv  fw}$			$\checkmark$		
$G_{\equiv bw}$				$\checkmark$	
$G_{\equiv fb}$			$\checkmark$	$\checkmark$	
$G_{\equiv fw,T}$			$\checkmark$		$\checkmark$
$G_{\equiv bw,T}$				$\checkmark$	$\checkmark$
$G_{\equiv fb,T}$			$\checkmark$	$\checkmark$	$\checkmark$

# Relations between RDF summaries [ČGM17b]

# Summary size comparison (more in [ČGM17b])

Graph G	G	Summary $G_{/\equiv}$	$ G_{/\equiv} $	$cf_{\equiv}$
DBLP	150,787,464	$G_{ m W}$	71	2,123,767
DBLP	150,787,464	G <sub>/S</sub>	206	731,978
DBLP	150,787,464	$G_{\rm /fw}$	262,695	574
LUBM1M	1,227,868	$G_{ m W}$	161	7,579
LUBM1M	1,227,868	G <sub>/S</sub>	207	5,903
LUBM1M	1,227,868	G <sub>/fw</sub>	1982	617
LUBM10M	11,990,183	$G_{ m W}$	162	74,013
LUBM10M	11,990,183	G <sub>/S</sub>	206	58,204
LUBM10M	11,990,183	G <sub>/fw</sub>	24,958	480
LUBM10M	11,990,183	G <sub>/bw</sub>	6,162	1,944
LUBM10M	11,990,183	G/fb	11,990,076	1

### Summarizing $\mathtt{G}^\infty$

Recall: With an RDF Schema, the semantics of G is  $G^\infty \Rightarrow$  We really need  $(G^\infty)_{/\equiv}!$ 

- Saturate G, then summarize
- 2 Can we avoid saturating G?...

### Summarizing $\mathtt{G}^\infty$

Recall: With an RDF Schema, the semantics of G is  $G^{\infty} \Rightarrow$ We really need  $(G^{\infty})_{/\equiv}!$ 

- Saturate G, then summarize
- 2 Can we avoid saturating G?...

#### Shortcut theorem [ČGM17a]

For the summaries  ${\tt G}_{\rm /W},~{\tt G}_{\rm /S},~{\tt G}_{\rm /fw},~{\tt G}_{\rm /bw},~{\tt G}_{\rm /fb}:$ 

 $({\tt G}^\infty)_{/\equiv}$  is the same as  $(({\tt G}_{/\equiv})^\infty)_{/\equiv}$ 

Also: sufficient condition for any  $\equiv$  to admit the shortcut.

#### Shortcut toward the summary of ${\tt G}^\infty$

 $\begin{array}{lll} \text{Direct} & {\tt G} \to {\tt sat.} \to {\tt G}^\infty \to {\tt summ.} \to ({\tt G}^\infty)_\equiv \\ \text{Shortcut} & {\tt G} \to {\tt summ.} \to {\tt G}_\equiv \to {\tt sat.} \to ({\tt G}_\equiv)^\infty \to {\tt summ.} \to (({\tt G}_\equiv)^\infty)_\equiv \end{array}$ 

If  $G_{\equiv}$  is much smaller than G, **the shortcut may be faster!** Up to 20 times in our experiments [ČGM17b]

#### Shortcut example: G<sub>W</sub>

### Shortcut counter-example: $G_{TW}$

#### Summary-enabled LOD cloud exploration

#### ILDA Inria team (E. Pietriga, H. Ozaygen) Use summary to derive visualisation instead of the original graph (smaller, faster)

# Part III

# Finding insights in RDF graphs

Ioana Manolescu

## Insight in an RDF graph

We consider an insight to be the result of an aggregation query over the RDF graph

We focus one-dimensional aggregates  $\Rightarrow$  2D layout

An insight is interesting if a certain measure (e.g., variance) on its set of aggregation values is high

Problem

**Problem:** given a graph G, find the top-k insights

**Dagger**: Digging for Interesting Aggregates in RDF Graphs [DMS17] (ongoing)

1. Candidate facts Resources from G: of a certain type, or having certain property sets

2. Candidate dimension Properties of the candidate facts, with strong support and relatively few distinct values.

Also: derived properties, e.g., authors count;

3. Candidate measure Another property of the candidate facts Also: automatic value typing

4. Candidate aggregation function Chosen depending on the measure type

### Dagger-selected aggregate in DBLP data

Average number of authors of journal articles, per publication year

## Dagger-selected aggregate in DBLP data

#### Number of book authors, per book publication year

### Dagger-selected aggregate in DBLP data

The number of books by each publisher (highest: Springer)

DEXA, Aug 2017 50 / 54

# Part IV

# Conclusion

Ioana Manolescu

#### The need for RDF graph discovery tools

- RDF graphs can be **large and complex**, they lack a prescriptive schema
- Semantic rules lead to implicit data
- Toward helping users to discover RDF graphs:
  - Structural quotient summaries representing the complete graph structure; compact clique-based summaries; available at:

https://team.inria.fr/cedar/projects/rdfsummary/

Insight discovery: interesting aggregate queries; project Web page:

https://team.inria.fr/cedar/projects/dagger/

 Many follow-up directions: parallelization, more interestingness measures, extensions to ML.
