Supplementary Table 1 : Results of linear mixed models for 224 electrodes analysis for amyloid status (A+ versus A-), FDG status (N+ versus N-), electrodes and interactions between amyloid status, FDG status and electrodes, for 10 EEG metrics. Marginal R-squared values (R2m) are indicated. Significant adjusted p-values on age, gender, education level, hippocampal volume and ApoE4 status are indicated with * $P < 0.05$. Significant Benjamini-Hochberg corrected p-values on 10 measures are indicated with * $P < 0.05$. A+ = Amyloid positive; A- = Amyloid negative; FDG = fluorodeoxyglucose; MSF = median spectral frequency; ; N+ = neurodegeneration positive; N- = neurodegeneration negative; pcorr = corrected p-value; PSD = power spectral density; SE = spectral entropy; wSMI = weighted symbolic mutual information.

Supplementary Table 2 : Results of multiple linear regression analysis of 14 average EEG metrics on all explanatory variables. Adjusted coefficient of determination R-squared values (R2), p-values and Benjamini-Hochberg corrected p values on 14 EEG metrics are shown. *P < 0.05. To maximize R-squared values, for each EEG metric, FDG and Florbetapir were used either as continuous or binary measures. ¥ FDG as continuous measure otherwise as binary measure ‡ Florbetapir as continuous measure otherwise as binary measure. A+ = Amyloid positive; A- = Amyloid negative; ApoE = Apolipoprotein E; FDG = fluorodeoxyglucose; MSF = median spectral frequency; N+ = neurodegeneration positive; N- = neurodegeneration negative; pcorr = corrected p-value; PLV = Phase Locking Value; PSD = power spectral density; SE = spectral entropy; wPLI = weighted Phase Lag Index; wSMI = weighted symbolic mutual information.
