HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Learning the Linux Kernel Configuration Space: Results and Challenges

Prof. Mathieu Acher (University of Rennes 1, Inria/IRISA)

@acherm

Talk given at ELC 2019 (30 october 2019)

- Abstract: “Given a configuration, can humans know in advance the size, the compilation time, or the boot time of a Linux kernel? Owing to the huge complexity of Linux (there are more than 15000 options with hard constraints and subtle interactions), machines should rather assist contributors and integrators in mastering the configuration space of the kernel. In this talk, Mathieu Acher will introduce TuxML an OSS tool based on Docker/Python to massively gather data about thousands of kernel configurations. Mathieu will describe how 200K+ configurations have been automatically built and how machine learning can exploit this information to predict properties of unseen Linux configurations, with different use cases (identification of influential/buggy options, finding of small kernels, etc.) The vision is that a continuous understanding of the configuration space is undoubtedly beneficial for the Linux community, yet several technical challenges remain in terms of infrastructure and automation.”
- This research was funded by the ANR-17-CE25-0010-01 VaryVary project
 - <https://varyvary.github.io/>

- Learning From Thousands of Build Failures of Linux Kernel Configurations
 - Mathieu Acher, Hugo Martin, Juliana Alves Pereira, Arnaud Blouin, Djamel Eddine Khelladi, Jean-Marc Jézéquel

Linux everywhere since highly configurable

```
config X86_X2APIC
    bool "Support x2apic"
    depends on X86_LOCAL_APIC && X86_64 && (IRQ_REMAP || HYPERVISOR_GUEST)
    ---help---
        This enables x2apic support on CPUs that have this feature.

        This allows 32-bit apic IDs (so it can support very large systems),
```

```
config IOSF_MBI
    tristate "Intel SoC IOSF Sideband support for SoC platforms"
    depends on PCI
    ---help---
        This option enables sideband register access support for Intel SoC
        platforms. On these platforms the IOSF sideband is used in lieu of
        MSR's for some register accesses, mostly but not limited to thermal
        and power. Drivers may query the availability of this device to
        determine if they need the sideband in order to work on these
        platforms. The sideband is available on the following SoC products.
```

```
#
# Processor type and features
#
# CONFIG_ZONE_DMA is not set
# CONFIG_SMP is not set
# CONFIG_X86_FEATURE_NAMES is not set
# CONFIG_X86_FAST_FEATURE_TESTS is not set
CONFIG_X86_X2APIC=y
CONFIG_X86_MPPARSE=y
CONFIG_GOLDFISH=y
# CONFIG_INTEL_RDT_A is not set
# CONFIG_X86_EXTENDED_PLATFORM is not set
CONFIG_IOSF_MBI=m
CONFIG_IOSF_MBI_DEBUG=y
CONFIG_X86_SUPPORTS_MEMORY_FAILURE=y
# CONFIG_SCHED_OMIT_FRAME_POINTER is not set
```

Kconfig files/doc

.config

15,000+ options

Configurations: Hell or Heaven?

Stop ou encore?

How to ensure that all configurations of the Linux kernel build/boot?

Many failures are due to buggy (combinations of) options
Devs/maintainers are struggling to track/fix bugs
Linus Torvalds: “random crazy user bugs” (random configurations are certainly a good subset)

Testing Linux kernels (on few configs):
(e.g., 0-day/KernelCI)

Given a kernel configuration, what's its size/boot time?

```
#  
# Processor type and features  
#  
# CONFIG_ZONE_DMA is not set  
# CONFIG_SMP is not set  
# CONFIG_X86_FEATURE_NAMES is not set  
# CONFIG_X86_FAST_FEATURE_TESTS is not set  
CONFIG_X86_X2APIC=y  
CONFIG_X86_MPPARSE=y  
CONFIG_GOLDFISH=y  
# CONFIG_INTEL_RDT_A is not set  
# CONFIG_X86_EXTENDED_PLATFORM is not set  
CONFIG_IOSF_MBI=m  
CONFIG_IOSF_MBI_DEBUG=y  
CONFIG_X86_SUPPORTS_MEMORY_FAILURE=y  
# CONFIG_SCHED_OMIT_FRAME_POINTER is not set
```

Who knows what's the effect of options?

Default configurations/options' values

Documentation (Kconfig)

Configurators

Effects of (combinations of) options on build status/boot/size/boot time/performance/security

```
# Processor type and features
#
# CONFIG_ZONE_DMA is not set
# CONFIG_SMP is not set
# CONFIG_X86_FEATURE_NAMES is not set
# CONFIG_X86_FAST_FEATURE_TESTS is not set
CONFIG_X86_X2APIC=y
CONFIG_X86_MPPARSE=y
CONFIG_GOLDFISH=y
# CONFIG_INTEL_RDT_A is not set
# CONFIG_X86_EXTENDED_PLATFORM is not set
CONFIG_IOSF_MBI=m
CONFIG_IOSF_MBI_DEBUG=y
CONFIG_X86_SUPPORTS_MEMORY_FAILURE=y
# CONFIG_SCHED_OMIT_FRAME_POINTER is not set
```

General problem:

Taming the configuration space

15,000+ options

TRISTATE	61.63	3 ⁹⁰⁰⁰
BOOL	36.40	
INT	1.54	2 ⁶⁰⁰⁰
STRING	0.29	
HEX	0.14	

Linux 5.2.8, arm
(% of types' options)

≈ 10⁶⁰⁰⁰ configurations
(without constraints)

Linux Kernel

≈ 10⁶⁰⁰⁰

configurations

Linux Kernel

$\approx 10^{6000}$ configurations

$\approx 10^{80}$ is the estimated number of atoms in the universe

$\approx 10^{40}$ is the estimated number of possible chess positions

Linux vs AlphaZero

Building a kernel configuration takes **10 minutes on average** on a recent machine

Trial and error is **cheap** for Chess/Go, you can experience winning/losing billions of time

AlphaZero vs Linux

In Chess/Go, you can fully observe the outcome, without noise and with a **perfect simulator**

Think about **technically measuring the boot time** of a kernel out of a configuration

Is taming the Linux kernel configuration space a harder problem than resolving Chess?

configurations

$\approx 10^{6000}$

$\approx 10^{40}$

exploration

costly and
hard to
engineer

cheap with a
perfect
simulator

You cannot build $\approx 10^{6000}$ configurations. TUXML: predicting out of a (small) sample of configurations' kernels

```
# Processor type and features

```

102.3Mb

Regression problem:
predict a quantitative value (eg size)
out of options values

You cannot build $\approx 10^{6000}$ configurations.
**TUXML: predicting out of a (small)
sample of configurations' kernels**

```
# Processor type and featur  
#  
# CONFIG_ZON  
# CONFIG_SMP  
# CONFIG_X86  
# CONFIG_X86  
CONFIG_X86_X  
CONFIG_X86_M  
CONFIG_GOLDF  
# CONFIG_INT  
# CONFIG_X86  
CONFIG_IOSF_MBI=m  
CONFIG_IOSF_MBI_DEBUG=y  
CONFIG_X86_SUPPORTS_MEMORY_FAILURE=y  
# CONFIG_SCHED_OMIT_FRAME_POINTER is not set
```

**You cannot build $\approx 10^{6000}$ configurations.
Is machine learning effective for such
very large configurable systems?**

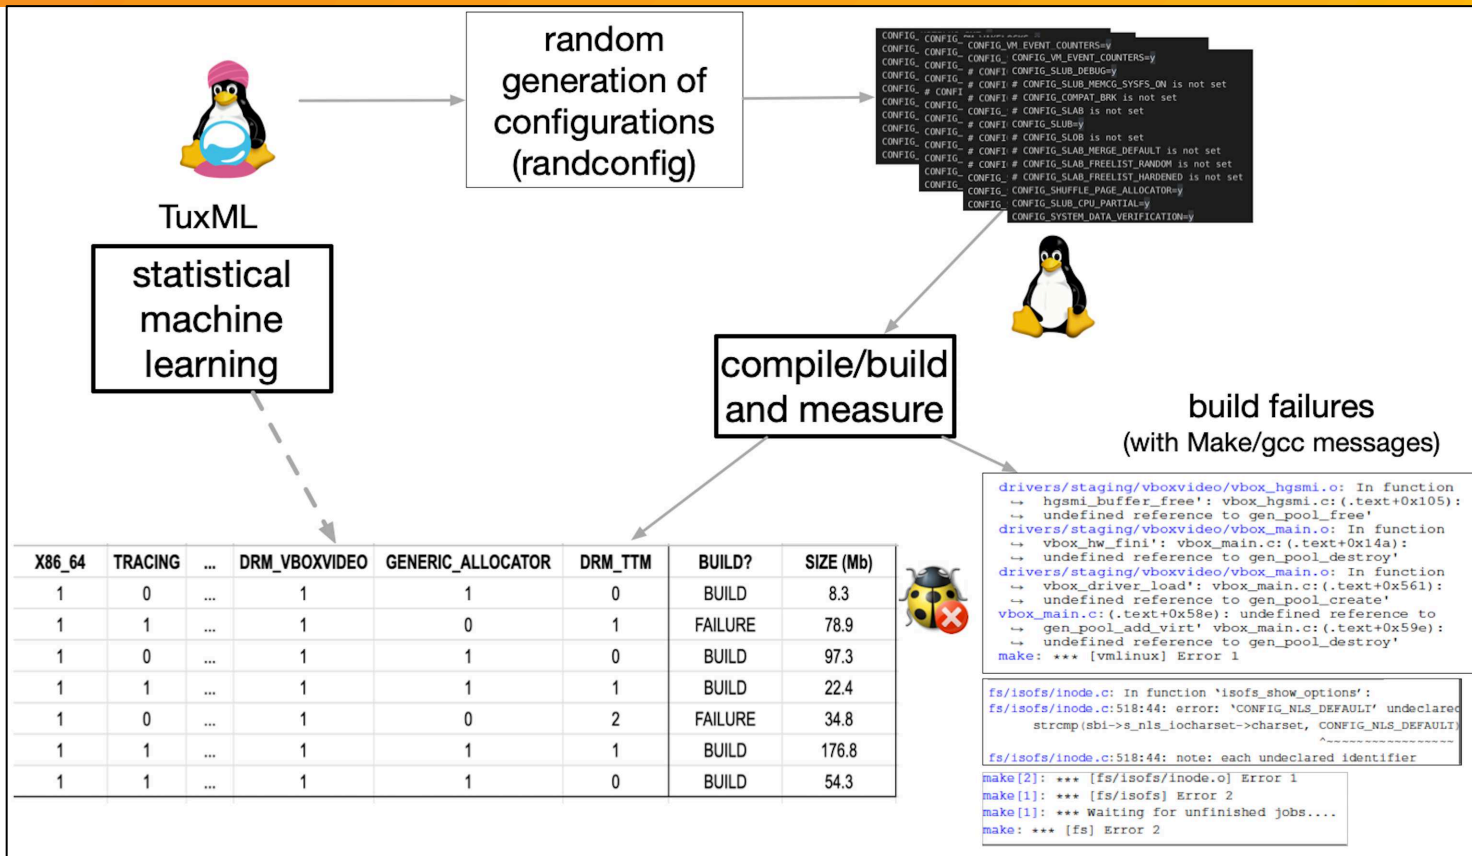

```
# Processor type and featur
#
# CONFIG_ZON
# CONFIG_SMP
# CONFIG_X86
# CONFIG_X86
CONFIG_X86_X
CONFIG_X86_M
CONFIG_GOLDF
# CONFIG_INT
# CONFIG_X86
CONFIG_IOSF_MBI=m
CONFIG_IOSF_MBI_DEBUG=y
CONFIG_X86_SUPPORTS_MEMORY_FAILURE=y
# CONFIG_SCHED_OMIT_FRAME_POINTER is not set
```

Answers in the rest of the talk

- Sampling and Learning with TUXML
- Results over 150K+ configurations
 - build failure understanding and prevention
 - kernel size prediction
- Challenges
 - “smart” build infrastructure
 - with devs/contributors in the loop

1	0.03	NEW_LEDS & ..	Linux	Kconfig dependency

Application 1: “Smart” build infrastructure

5.83% of build failures can be explained by
16 config. bugs of Linux and **3** config. bugs of TUXML

Don't trust your configuration build infrastructure!
Prevent/Fix as early as possible configuration bugs
(otherwise you won't see other bugs!)

Bug **location/understanding**: TUXML can help to pinpoint
responsible options (and avoid sending duplicate bugs)
TUXML can **prevent failures** and avoid building buggy
configs (until a fix is done) with a good accuracy

Application 2: Kernel Size Prediction

https://elinux.org/Kernel_Size_Tuning_Guide - Tim Bird (Sony)

Linux kernel tinification/tinyconfig - Josh Triplett (Intel)

Challenges of Low Spec Embedded Linux - Alexander Sack, Pantacor

Timing Boot Time Reduction Techniques - Michael Opdenacker, Bootlin
@ ELC 2019

Unfortunately, nobody knows the precise effect of (combinations of) options on size

Kconfig: (only?) 150 options are explicitly referring to size

Regression problem: predict a quantitative value (eg size) out of options values

config KERNEL_XZ

bool "XZ"

depends on HAVE_KERNEL_XZ

help

XZ uses the LZMA2 algorithm and instruction set specific BJC filters which can improve compression ratio of executable code. The size of the kernel is about 30% smaller with XZ in comparison to gzip. On architectures for which there is a BJC filter (i386, x86_64, ARM, IA-64, PowerPC, and SPARC), XZ will create a few percent smaller kernel than plain LZMA.

Table 1: MAPE of different learning algorithms for the prediction of vmlinux size, without and with feature selection

We find a sweet spot where only 200–300 features are sufficient to efficiently train a random forest and a Gradient Boosting Tree to obtain a prediction model that outperforms other baselines (7% prediction errors for 40K configurations). We observe similar feature selection benefits for any training set size and tree-based learning algorithms.

up to ~3% for
compressed
kernels sizes!

**Towards smart
configuration assistant
(optimizer/recommender/
configurator)**

Session 2: Kernel Size Prediction

Thanks to our prediction model, we have effectively identified a list of important features that is consistent with the options and strategy of tinyconfig, the Kconfig documentation, and Linux knowledge. We also found options that can be used to refine or augment the documentation.

Linux knowledge
about options

Challenges

- Retrospectively and despite our investment, we found relatively few bugs of Linux
 - Is it due to the way we sample?
 - Is it due to the stable version of Linux we chose?
 - Is it due to the high-quality of Linux, its contributors and its industry-strength, community-based effort?

Challenges

- Sampling is based on randconfig
 - randconfig does not produce uniform random samples
 - hypothesis: the testing “community” has over-fitted randconfig
- We need other sampling strategies!
 - Uniform (but SAT-based techniques should be improved)
 - Coverage-based sampling (e.g., t-wise)
 - Knowledge-based sampling

Challenges

- The cost of gathering data is important (15K+ hours of computation)
- Incremental build of configurations
- Bugs do not transfer well
- However, kernel size “knowledge” may transfer
 - Instead of starting from scratch, we can transfer a prediction model for another version of Linux (ongoing work)

Challenges

- Kernel CI / 0-day
 - Our focus: testing **configurations** in the large
 - Complementary!
 - **Learning** techniques can be used in both contexts
 - Sharing data
- Unify the force!

Challenges

- “Smart” build infrastructure
 - Other properties (e.g., warnings, boot, security)
- With devs/contributors in the loop
 - We need knowledge to validate our learning model
 - We need knowledge to apply “smart” sampling
 - We aim to produce actionable knowledge
- TUXML needs you!
