# A journey in the history of Automated Driving

*Christian LAUGIER – PhD & Dr Es Science*

*Research Director at Inria & Scientific Advisor for Probayes and for Baidu China*

*Inria Chroma team & IRT Nanoelec – christian.laugier@inria.fr*

**Invited Pioneer's Talk**

*IROS 2019, Macau, China, November 6<sup>th</sup> 2019*

*Contributions: L. Rummelhard, A. Negre, N. Turro, J.A. David, J. Lussereau, T. Genevois, C. Tay Meng Keat, S. Lefevre, O. Erkent, D. Sierra-Gonzalez ... and also numerous former PhD students and Postdocs*

# Automobile & Human Mobility

## *A current Technological & Psychological breakthrough*

*On-going change of the  
role & concept of **private**  
car in human society !*

*Last century => Ownership & Feeling of Freedom  
Affective behaviors & Shown Social position  
Driving pleasure ... **but less and less true !***

*Next cars generation => Focus on **Technologies** for  
Safety & Comfort & Reduced Pollution  
**Driving Assistance v/s Autonomous Driving***

### Context of this recent evolution

- *Expected 3 Billions vehicles & 75% population in cities in 2050 => **Current model not scalable !***
- *Accidents: ~1.2 Million fatalities/Year in the world => **No more accepted by the human society !***
- *Driving safety & Nuisance issues (pollution, noise, traffic jam, parking ...) are becoming **a major issue for Human Society & Governments & Industry***
- *Technology & Internet & Ecology & Economic issues progressively change **mobility habits** of people => **Towards Less ownership & More shared mobility systems & Increased Autonomy ... e.g. Uber, BlaBlaCar, Tesla Autopilot, Waymo...***

# Early steps towards Autonomous Cars

## □ Early dream (1956):

*“Central Power & Light Company” predict Autonomous Cars  
.... on Electric super-highway*

*Advertorial: “ELECTRICITY MAY BE THE DRIVER. One day your car may speed along an electric super-highway, its speed and steering automatically controlled by electronic devices embedded in the road. Highways will be made safe – by electricity! No traffic jams ... no collisions ... no driver fatigue”*

## □ EU: Some milestones in the 80's

VaMORs, Munchen Univ, 1986

- First autonomous vehicle on a road (mainly based on CV): VaMORs prototype, Dickmann, Munchen University, 1986
- EU project Prometheus (1987-95, ~750 M€), Largest R&D project on driverless cars (involving EU Industry & Universities)  
=> Large public demonstration in Paris in 1994

# EU: Some results in the 90's

**Automatic parking, Inria, 1996**  
(low cost sensors, no map)

**City Platooning & Concept of shared cars**  
Inria, 1997

**Cycab concept (urban people mover)**  
Inria

[https://en.wikipedia.org/wiki/Automatic\\_parking](https://en.wikipedia.org/wiki/Automatic_parking)

- ⇒ *One of the world's first experimental prototypes of automatic parallel parking was developed on an electric car Ligier at INRIA in the mid-1990s<sup>[1][3]</sup>.*
- ⇒ *The underlying technology has been adopted by major automobile manufacturers offering an automatic parking option in their cars today.*
- ⇒ *First commercial version of the automatic parallel parking concept on Toyota Lexus in 2010.*

[1] I. Paromtchik & C. Laugier, « Autonomous Parrallel Parking of a Nonholonomic Vehicle », IEEE Intelligent Vehicle Symposium 1996, Tokyo, Japan.

# International Events & Projects *(A great impact, 1<sup>st</sup> decade 21<sup>st</sup> century)*

**USA 2004 & 2006: Darpa Grand Challenges (High speed & Off-road)**  
=> Significant step towards Motion Autonomy... But still some uncontrolled behaviors in 2004

**USA 2007: Darpa Urban Challenge (97 km, 50 manned & unmanned vehicles, 35 teams)**  
=> Impressive progress towards autonomous driving .... but still some collisions (Perception & Decision-making failures)

**EU 2010: VIAC Intercontinental Autonomous Challenge (A. Broggi, Parma)**  
=> 13 000 km covered, 3 months race, leader + followers

**USA 2011: Google Car project (1<sup>st</sup> large Industrial project on AD)**  
*Fleet of 6 automated Toyota Prius, costly 3D lidar (dense mapping)  
140 000 miles covered on California roads with occasional human interventions*

# Technology status & Ongoing challenges for AVs

- Strong involvement of Car Industry & GAFA + Large media coverage + Increasing Governments supports
- An expected market of 515 B€ at horizon 2035 (~17% world automobile market, Consulting agency AT Kearney, Dec 2017)
- But Legal & Regulation issues are still unclear ... idem for Technologies Validation & Certification issues !

=> Numerous experiments in real traffic conditions since 2010 (Disengagement reports & Insights on system maturity)

=> But still insufficient ... Realistic Simulation & Formal methods are also under development (e.g. EU Enable-S3)

“Self-Driving Taxi Service L3” testing in US (Uber, Waymo) & Singapore (nuTonomy)  
=> **Autonomous Mobility Service**, Numerous Sensors + “Safety driver” during testing (take over in case)  
=> **Uber**: System testing since 2017, Disengagement every 0.7 miles in 2017 (improved now)  
=> **Waymo**: 1<sup>st</sup> US Self Driving Taxi Service launched in Phoenix in Dec 2018  
=> **Disengagement reports provide insights on the technology maturity**

Millions of miles driven since 2010 (Google, Tesla, Waymo, Uber...)  
Several benign & serious accidents in past few years  
Safety is still not guaranteed!

# Fatal accidents involving AVs – *Perception failure*

- ❑ Tesla driver killed in a crash with Autopilot “level 2” active (*ADAS mode*) – May 2016

- ✓ *The Autopilot failed to detect a white moving truck, with a brightly lit sky (Camera Mobileye + Radar)*
- ✓ *The human driver was not vigilant & didn't took over*

- ❑ Self-driving Uber L3 vehicle killed a woman  
=> *First fatal crash involving a pedestrian*  
*Tempe, Arizona, March 2018*

- ✓ *Despite the presence of multiple sensors (lidars, cameras ...), the perception system failed to detect the pedestrian & didn't disengaged*
- ✓ *The Safety Driver reacted too lately (1s before the crash)*

# AVs have to face two main challenges

## Challenge 1: The need for Robust, Self-diagnosing & Explainable **Embedded Perception**

*Video source: AutoPilot Review @ youtube.com*

### **Video Scenario:**

- *The Tesla perception system failed to detect the barriers blocking the left side route.*
- *The driver has to take over and steer the vehicle away from the blocked route (for avoiding the collision).*

# AVs have to face two main challenges

## Challenge 2: The need for Understandable **Driving Decisions** (*share the road with human drivers*)

Unfortunately **Human drivers actions** are determined by a complex set of interdependent factors difficult to model  
(*e.g. intentions, perception, emotions ...*)

⇒ Predicting **human driver behaviors is inherently uncertain**

⇒ AV have to reason about **uncertain intentions** of the surrounding vehicles

The Lexus SUV, fitted with special sensors, struck the public bus on February 14 in Mountain View, California

*Video source: The Telegraph*

**Video scenario** (*Scene observed by the dash cam of a bus moving behind the Waymo AV*)

- *Waymo AV is blocked by an obstacle and it decides to execute a left lane change*
- *The bus driver misunderstood the Tesla's intention and didn't yield*
- *he two vehicles collided*

# Perception & Decision-making requirements for AVs

## Dynamic Scene Understanding & Navigation Decisions

### Situation Awareness & Decision-making

- ⇒ Sensing + Prior knowledge + Interpretation
- ⇒ Selecting appropriate Navigation strategy (planning & control)

## ADAS & Autonomous Driving

### Embedded Perception & Decision-making for Safe Intentional Navigation

## Dealing with unexpected events

### Anticipation & Risk Prediction technologies for avoiding upcoming collisions with "something"

- ⇒ High reactivity & reflexive actions
- ⇒ Focus of Attention & Sensing
- ⇒ Collision Risk estimation + Avoidance strategy

## Main features

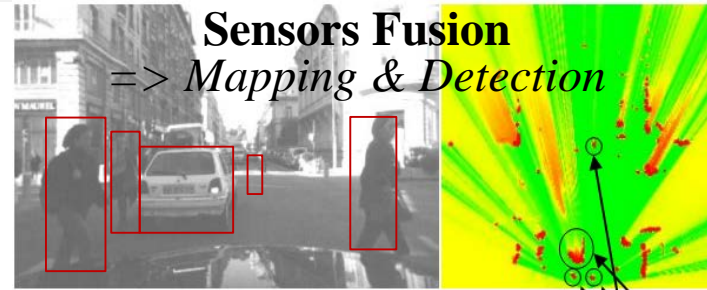

- ✓ Dynamic & Open Environments ⇒ *Real-time processing & Reactivity (several reasoning levels are required)*
- ✓ Incompleteness & Uncertainty ⇒ *Appropriate Model & Algorithms (probabilistic approaches)*
- ✓ Sensors limitations (no sensor is perfect) ⇒ *Multi-Sensors Fusion*
- ✓ Hardware / Software integration ⇒ *Satisfying Embedded constraints*
- ✓ Human in the loop (mixed traffic) ⇒ *Human Aware Decision-making process (AI based technologies)*  
*Taking into account Interactions + Behaviors + Social rules (including traffic rules)*

# 1<sup>st</sup> Paradigm : Embedded Bayesian Perception

**Embedded Multi-Sensors Perception**  
⇒ *Continuous monitoring of the dynamic environment*

## ❑ Main challenges

- ✓ *Noisy data, Incompleteness, Dynamicity, Discrete measurements*
- ✓ *Strong Embedded & Real time constraints*

## ❑ Our Approach: Embedded Bayesian Perception

- ✓ *Reasoning about Uncertainty & Time window (Past & Future events)*
- ✓ *Improving robustness using Bayesian Sensors Fusion*
- ✓ *Interpreting the dynamic scene using Contextual & Semantic information*
- ✓ *Software & Hardware integration using GPU, Multicore, Microcontrollers...*

# Bayesian Perception : Basic idea

## □ Multi-Sensors Observations

*Lidar, Radar, Stereo camera, IMU ...*

## □ Probabilistic Environment Model including Dynamics

$P[o|Z,C] :$      $\approx 0$      $\approx 0.5$      $\approx 1$

### Concept of “Dynamic Probabilistic Grid + Bayesian Filtering”

- ⇒ Clear distinction between *Static* & *Dynamic* & *Free* components
- ⇒ Occupancy & Velocity probabilities
- ⇒ Designed for Highly Parallel Processing (to satisfy real-time constraints)
- ⇒ Includes Embedded Models for Motion Prediction & Collision Risk Assessment
- ⇒ Patented technology & Industrial licenses 2018 (Toyota, Easymile)

[PhD Thesis Coué 2005]  
[Coué & Laugier IJRR 2005]  
[Laugier et al ITSM 2011]  
[Rummelhard et al ITSC 2015]  
[Mooc uTOP 2015]

## □ Main philosophy

*Reasoning at the grid level as far as possible for both :*

- *Improving Efficiency & Reactivity to unexpected events* => *Highly parallel processing & High frequency !*
- *Avoiding most of traditional object level processing problems* (e.g. detection errors, wrong data association...)

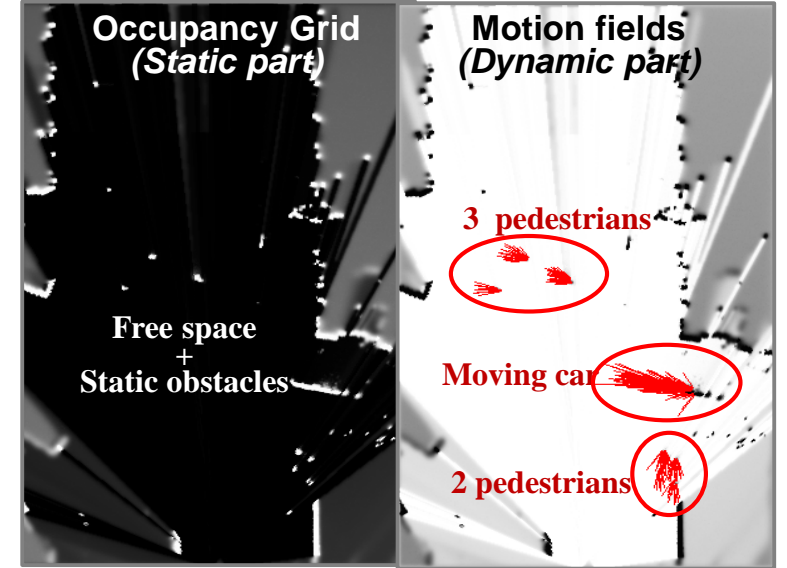

# Dynamic Probabilistic Grid & Bayesian Filtering – *Main Features*

=> *Exploiting the dynamic information for a better understanding of the scene*

Sensors data fusion  
+  
Bayesian Filtering  
+  
Extracted Motion Fields

1<sup>st</sup> Embedded & Optimized version  
(HSBOF, patent 2014)

## Patented Improvements & Implementations (2015, 2017)

Detection & Tracking + Moving Objects Classification  
=> CMCDOT 2015 (including a “Dense Occupancy Tracker”)

Ground Estimation & Point Cloud Classification  
(patent 2017)

# System Integration on a Commercial Vehicle

- **POC 2019: Complete system implemented on Nvidia TX1**, and easily connected to the shuttle system network *in a few days* (using ROS)
- **Shuttle sensors data** has been fused and processed in **real-time**, with a successful Detection & Characterization of the **Moving & Static Obstacles**
- **Full integration on a commercial product** under development with an industrial company (confidential)

*Point cloud classification, with two pedestrians moving respectively in front and behind the shuttle*

*CMCDOT filtered Occupancy Grid + Inferred Velocities + Collision Risk + Objects segmentation*

# 2<sup>nd</sup> Paradigm: Collision Risk Assessment & Decision-making

=> Decision-making for avoiding Pending & Future Collisions

## □ Main challenges

*Uncertainty, Partial Knowledge, World changes, Real time*

*Human in the loop + Unexpected events + Navigation Decision based on Perception & Prior Knowledge*

## □ Approach: Prediction + Risk Assessment + Bayesian Decision-making

- ✓ Reason about *Uncertainty & Contextual Knowledge* (using **History & Prediction**)
- ✓ Estimate Probabilistic Collision Risk at a given **time horizon**  $t+\delta$  ( $\delta$  = a few seconds)
- ✓ Make Driving Decisions by taking into account the **Predicted behavior** of all the observed surrounding traffic participants (cars, cycles, pedestrians ...) & **Social / Traffic rules**

## □ Decision-making: Two types of “collision risk” have to be considered

- ✓ *Short-term collision risk* => Imminent collisions with “something” (unclassified), time horizon  $<3s$ , conservative hypotheses
- ✓ *Long-term collision risk* => Future potential collisions, horizon  $>3s$ , Context + Semantics, Behavior models

# **Concept 1: Short-term collision risk** (*Basic idea*)

=> *How to deal with unexpected & unclassified events (i.e. “something” is moving ahead) ?*

=> *Exploit previous observations for anticipating future objects motions & related potential future collision*

Autonomous  
Vehicle (Cycab)

Parked Vehicle  
(occultation)

**Pioneer Results  
(2005)**

*[PhD Thesis C. Coué 2004]  
[Coué & Laugier & al IJRR 05]*

Thanks to the prediction capability of the BOF technology, the Autonomous Vehicle “anticipates” the pedestrian motion and brakes (*even if the pedestrian is temporarily hidden by the parked vehicle*)

# Short-term collision risk – *Main Features & Results*

=> *Grid level & Conservative motion hypotheses (proximity perception)*

Proximity perception:  $d < 100\text{m}$  and  $t < 5\text{s}$

$\delta = 0.5\text{s}$  => Precrash

$\delta = 1\text{s}$  => Collision mitigation

$\delta > 1.5\text{s}$  => Warning / Emergency Braking

## □ Main Features

- Detect “*Upcoming potential Collisions*” a few seconds ahead (3-5s) in the *Dynamic Grid*
- Risky situations are *both localized in Space & Time* (under conservative motion hypotheses)
- Resulting information is used for choosing the most appropriate *Collision Avoidance Maneuvers*

## □ Experimental results

### Collision Risk Assessment (video 0:45)

- **Yellow** => time to collision: 3s
- **Orange** => time to collision: 2s
- **Red** => time to collision: 1s

## **Concept 2: Long-term Collision Risk** *(Object level)*

*=> Increasing time horizon & complexity using Context & Semantics*

*=> Key concepts: Behaviors Modeling & Prediction + Traffic Participants Interactions*

### Decision-making in complex traffic situations

- ✓ *Understand the current traffic situation & its likely evolution*
- ✓ *Evaluate the Risk of future collision by reasoning on traffic participants Behaviors*
- ✓ *Takes into account Context & Semantics*

*Highly structured environment & Traffic rules  
make Prediction more easy*

#### **Context & Semantics**

*History + Space geometry + Traffic rules*

+

#### **Behavior Prediction & Interactions**

*For all surrounding traffic participants  
(using learned models)*

+

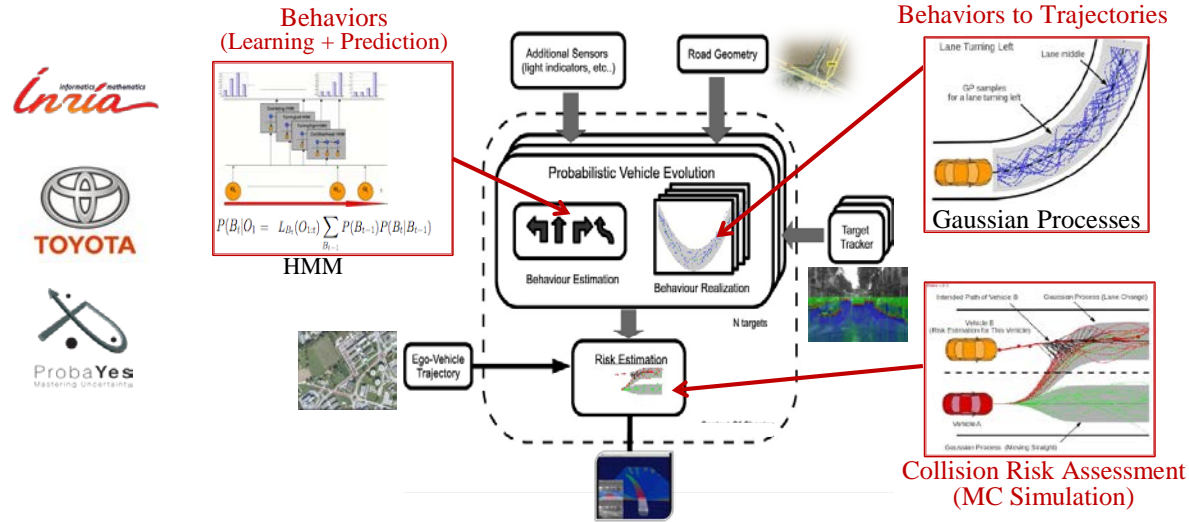

#### **Probabilistic Risk Assessment**

# Behavior-based Collision risk – *Main approaches & Results*

=> *Increased time horizon & complexity + Reasoning on Behaviors & Interactions*

## □ Trajectory prediction & Collision Risk => *Patent 2010 (Inria, Toyota, Probayes)*

*Cooperation still on-going  
(R&D contracts + PhD)*

Courtesy Probayes

## □ Intention & Expectation (Mixed Traffic & Interactions) => *Patents 2012 (Inria - Renault) & 2013 (Inria - Berkeley)*

**Human-like reasoning**

*Cooperation still on-going  
(R&D contracts + PhD)*

# 3<sup>rd</sup> Paradigm: Models improvements using Machine Learning

## □ Perception level: *Construct “Semantic Grids” using Bayesian Perception & DL*

## □ Decision-making level: *Learn driving skills for Autonomous Driving*

- ❖ *1<sup>st</sup> Step: Modeling Driver Behavior using Inverse Reinforcement Learning (IRL)*
- ❖ *2<sup>nd</sup> Step: Predict motions of surrounding vehicles & Make Driving Decisions for Ego Vehicle*

# Perception Level: Semantic Grids (Bayesian Perception + DL)

**Objective:** Add *Semantic information* (cars, pedestrians, roads, buildings...) in each cell of the Dynamic Occupancy Grid model, by exploiting *additional RGB inputs*

**Approach:** A new “Hybrid Sensor Fusion approach” combining *Bayesian Perception & Deep Learning*

[1] [2] + Patent 2019 (Inria, Toyota)

**Intermediate layers (~20 layers)**  
=> Learns the approximate heights of the classes/objects  
=> No 3D reconstruction required & Less sensitive to calibration errors (initial camera/3D points calibration)

[1] Semantic grid estimation with a Hybrid Bayesian and Deep Neural Network approach, O. Erkent et al., IEEE IROS 2018

[2] Conditional Monte Carlo Dense Occupancy Tracker, Rummelhard et al., ITSC 2015

[3] Segnet: A deep convolutional encoder-decoder architecture for image segmentation, Badrinarayanan et al., IEEE PAMI 39(12) 2017

# Semantic Grids – *Experimental Evaluation Approach*

**Frontal View (RGB camera)**

**Frontal View Ground-Truth**  
=> labelled by humans in training datasets

## Hybrid Sensor Fusion approach (Semantic Grid construction)

**Bird's Eye View Ground-Truth**  
=> Frontal View GT “projected” using  
Point-Cloud (Bayesian Perception)  
=> Densified by humans (point-clouds  
and images have different resolutions)

**Comparison**

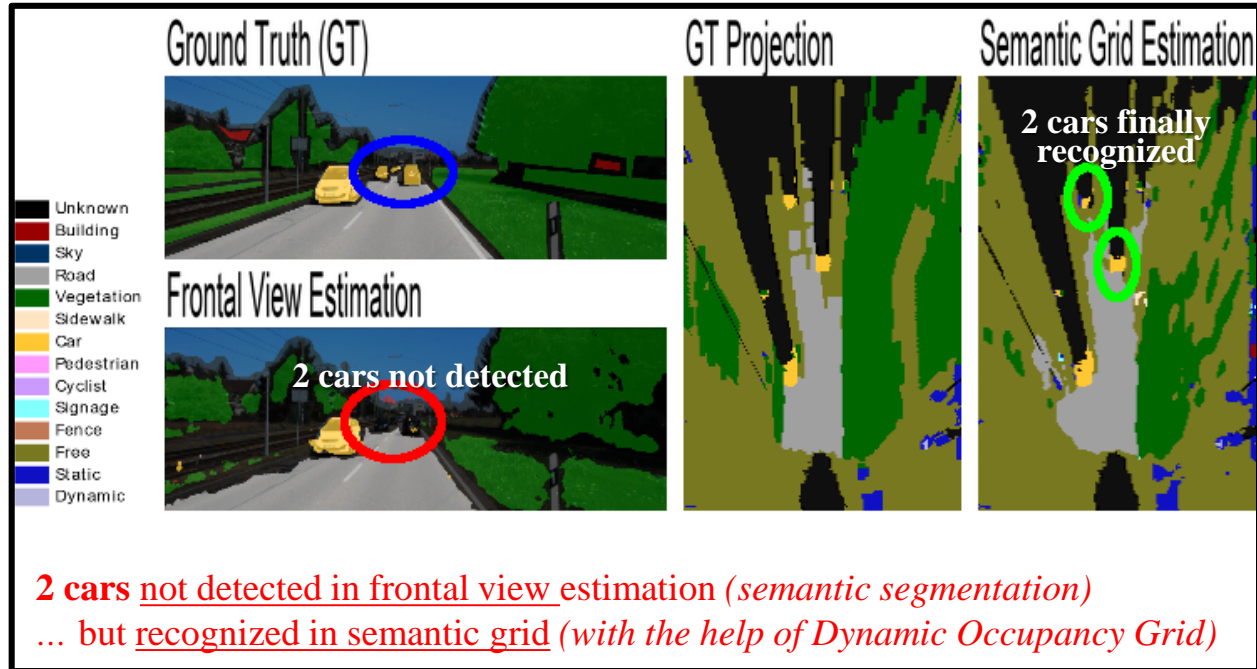

**Semantic Grid Prediction**  
=> Dense structure obtained using  
hybrid integration

# Semantic Grids – *Experimental Results*

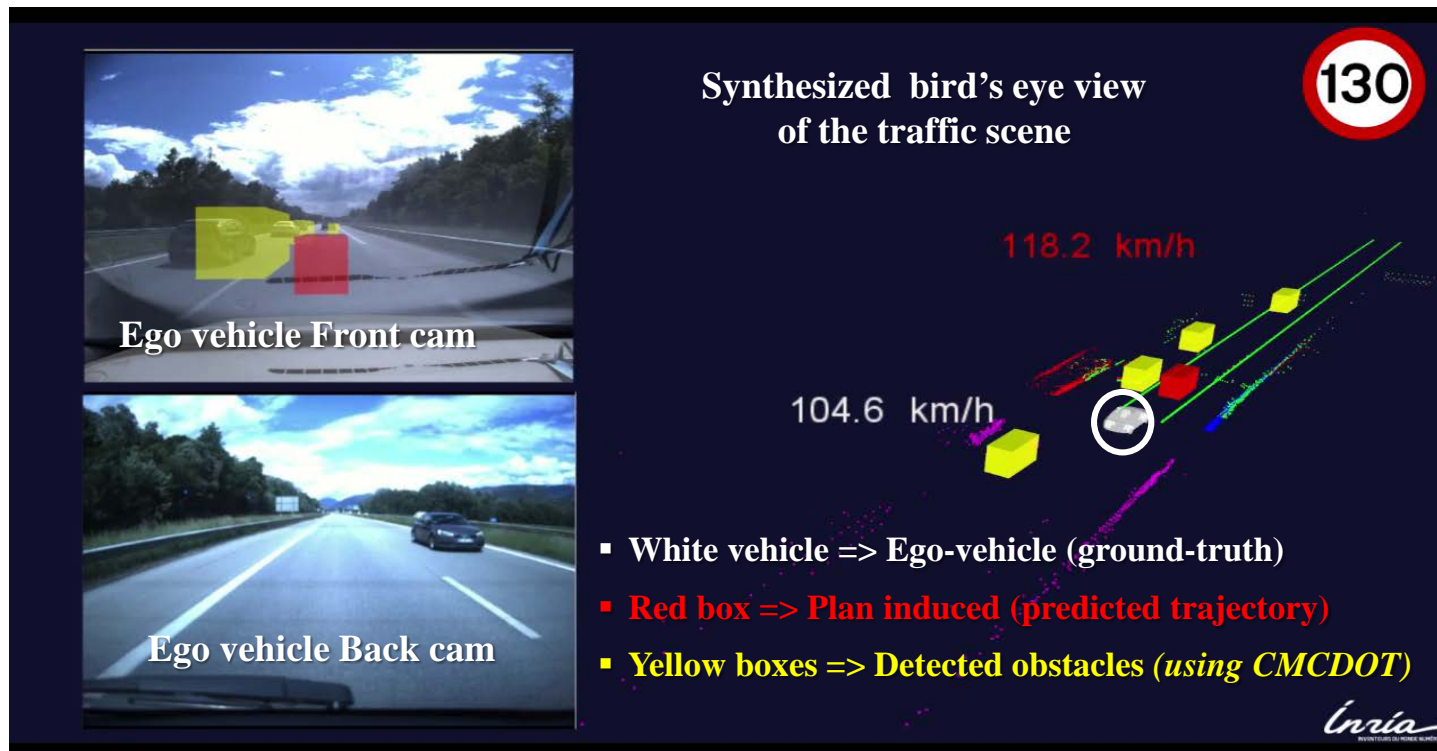

# Decision-making level: Learning Driving Skills for AD

## 1<sup>st</sup> Step: Driver behavior modeling

- Learn Model parameters from real driving demonstrations using *Inverse Reinforcement Learning (IRL)*
  - Driver behaviors are modelled using a **Cost function**  $\mathcal{C}(s) = \sum_{i=1}^K w_i \cdot f_i(s)$  which is assumed linear on a set of **K hand-crafted features** (*e.g. Lane index preferences, Deviation from desired velocity, TTC to frontal targets, Time-gap to rear targets ...*)
  - A training set containing “interesting highway vehicle interactions” has been first constructed using our *Lexus vehicle*
- => Obtained models can be leverage to **Predict human driver behaviors & Generate human-like plans for the ego vehicle** (*mandatory in mixed traffic*)
- [Sierra Gonzalez et al, ICRA 2018]

Comparison between demonstrated behavior in test set & behavior induced by the learned model

# Decision-making level: Learning Driving Skills for AD

## 2<sup>nd</sup> Step: Motion Prediction & Driving Decisions

- A realistic **Human-like Driver Model** can be exploited to **Predict the long-term evolution** (10s and beyond) of traffic scenes *[Sierra Gonzalez et al., ITSC 2016]*
  - For the **short/mid-term**, both the **Driver model** and the **Dynamics of the target** provide useful information to **determine future driving behaviors**
- => Our probabilistic model fuses **Model-based Predictions & Dynamic evidence** to produce robust **lane change intention estimations** in highway scenes *[Sierra Gonzalez et al., ICRA 2017]*

Comparison between demonstrated behaviors in test set & behaviors induced by the learned model & dynamics evidence

# Summary & On going work

## □ Autonomous Driving in various Traffic & Context situations (*cooperation with industry*)

Autonomous Shuttles  
(~15 km/h, Urban traffic)

Autonomous Bus (Iveco)  
(up to 70 km/h, Urban traffic)

Autonomous Renault Zoe  
(up to 70 km/h, Urban traffic)

- Various Dynamics & Motion constraints & Contexts
- Adapted “Collision Risk” & “Collision avoidance maneuvers” (Risk & Maneuver characterization)
- **Cooperation IRT Nanoelec, Renault, Iveco ...**

## □ Embedded & Extended “Semantic Grids” (*to improve scene understanding & decision-making*)

- Embedded “Semantic Grids” & “Panoptic Segmentation”
- Improved scene understanding (various weather conditions)
- **Cooperation Toyota**
- 1 Patent & 3 publications (IROS'18, ICARCV'18, Unmanned System journal 2019)

## □ Autonomous Driving in mixed traffic & Various traffic conditions (Prediction & Planning)

- **Driver Behavior modeling** using Driving dataset & Inverse Reinforcement Learning  
=> **Human-like Driver Model** (for mixed traffic)
- **Motion Prediction & Driving Decision-making for AD** performed by combining “learned Driver models” & “Dynamic evidences”
- **Cooperation Toyota**
- 2 Patents & 3 publications (ITSC 2016, ICRA 2017, ICRA 2018) & PhD Thesis 2019

# Thank You
