HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Relations between irreducible and absorbing Markov chains

Gerardo Rubino, Inria, France

Presentation in the Special Session SS 27A “Celebrating MM Rao’s Many Mathematical Contributions as he Turns 90 Years Old”, at the Fall Western Sectional Meeting of the AMS, Riverside, California, November 9–10, 2019.

Abstract

Irreducible Markov chains in continuous time are the basic tool for instance in performance evaluation (typically, a queuing model), where in a large majority of cases, we are interested in the behavior of the modeled system in steady-state. Most metrics used are based on the stationary distribution of the model, under unicity natural conditions. Absorbing Markov chains, also in continuous time, play the equivalent role in dependability evaluation, because realistic models must have a finite lifetime, which corresponds here to the absorption time of the chain. In this case, the object of interest is this lifetime, steady-state gives no useful information about the system, and most of the used metrics are defined based on that object. This talk will describe different connections between the two worlds together with some consequences of those relations in both areas, that is, both in performance and in dependability.
