1 Introduction

Edward Sang (1805–1890) was probably the greatest calculator of logarithms of the 19th century [3, 11, 12, 13, 22, 27]. Sang spent 40 years computing tables of logarithms and trigonometric functions, with the assistance from his daughters Flora (1838-1925) and Jane (1834-1878). The result fills about 50 manuscript volumes, plus a number of transfer duplicates, which are kept at Edinburgh University Library and at the National Library of Scotland, Edinburgh. I have reconstructed a number of these tables and an overview of the tables and reconstructions can be found in a separate guide [34].

Sang's purpose was in particular to provide fundamental tables, including for the decimal division of the quadrant. In 1890 [3, p. 189], he wrote that

> In addition to the results being accurate to a degree far beyond what can ever be needed in practical matters, [the collection of computations] contains what no work of the kind has contained before, a complete and clear record of all the steps by which those results were reached. Thus we are enabled at once to verify, or if necessary, to correct the record, so making it a standard for all time.
>
> For these reasons it is proposed that the entire collection be acquired by, and preserved in, some official library, so as to be accessible to all interested in such matters; so that future computers may be enabled to extend the work without the need of recomputing what has been already done; and also so that those extracts which are judged to be expedient may be published.

The present document describes volumes K1, K2 and K3 which contain the steps used for the construction of the logarithms of the primes.[1] The three volumes have a continuous page numbering.

2 Volume 1 (K1)

Volume 1 (up to page 240) gives the logarithms of the primes up to 2000, as well as a few others. It starts with an introductory notice by Sang.

[1] **Important note to future researchers:** This document, as well as others related to the reconstruction of Sang's tables, contains some shortcomings, some of which can easily be completed by others. Known shortcomings are marked in the margins with the sign "✻". Please, let me know of your work so that I can improve mine.

2.1 Sang's introduction

I reproduce here Sang's notice as it appears at the beginning of volume 1 (K1, Acc 10780/16). This introduction covers pages 3-11 and 13. There is no page 12 and it is not missing.

Notice.

The following calculations were undertaken with the ultimate view of forming a nine place table of the logarithms of all numbers under a million: a table which is desired by a gradually increasing number of computers

The ordinary seven place tables suffice perfectly for all the ordinary work of geodetical and astronomical calculation; and, with management, for a great part of the more delicate computations; but few who have ever engaged in the toil of computing original tables have failed to become sensible of the facilities which a more extended logarithmic canon would afford them.

The rapidly increasing exactitude of astronomical data, the delicacy of modern instruments and the improvements in all branches of applicate mathematics, promise soon to render such tables not merely desirable but absolutely requisite to original computers. At the same time we must admit that for many, very many, years the demand for such an extensive work must fall sadly short of repaying the labour and expense attending its construction.

In order to obtain the last digits true it is necessary to carry the manuscript calculations several places further, and afterwards to cut off the additional places augmenting the last retained figure whenever those rejected exceed 50000.... Here however it may happen that we have to do with 4999...998 or 5000...002 and as there must always be an uncertainty of two or three units in the last computed place, it follows that there is then an uncertainty in the last retained one. Now among a million numbers the probability is that if we carry the entire figures to six places, each of these may occur once:[2] so that if we make the manuscript calculation to fifteen places we may anticipate five or six cases of uncertainty. Were we to carry the work to one or two places more the chance

[2]Sang means that each of the sequences 499998, 499999, 500000, 500001, and 500002 has a probability of occuring once among a million random decimal numbers. If the computations are extended to seven places, then the probability of one of the 7-digit sequences 4999998, 4999999, etc., occuring, is 0.1.

of having an uncertainty would be almost nothing: but for each such place we shall have a million of figures in the logarithms and another couple of millions in the first and second differences — the mere writing out of which implies time and toil. Hence it will be more economical to rest at the fifteenth place, and to make a special calculation for each doubt that arises.

To reduce the probability of error to two or three units in the last place, that is in the fifteenth we must carry the logarithms of the smaller primes a few steps further, since by repeated additions their defects or excesses are multiplied: on this account I determined to compute as far as ten thousand to twenty-five places; up to one-hundred thousand to twenty places, and latterly to restrict the million table to fifteen. In projecting such a mass of work, more than any single man can hope to accomplish, it was natural to turn to the 60 place table printed in Callet's Tables Portatives,[3] and in the earlier editions of Hutton. But it at once appeared that no sufficient account of the computation of this table is given and that errors may have existed in it without any likelyhood of detection: while these errors would become excessively entangled in any after-work founded upon them, I therefore rejected the idea of trusting to the sixty place table and resolved to commence at the very beginning. However I judged it sufficient to compute the logarithms of the primes given by Callet only once, accepting the coincidence as sufficient proof of accuracy: and here I gladly bear testimony to the value of Callet's table in this far that to twenty-seven places I have found it exact; in the twenty-eighth place, which is the limit of the following manuscript work, small and to-be-looked-for deviations occurred: the figures in Callet were then adopted in preference to my own.

After passing 1100 it became necessary to compute the logarithm of each prime by two independent methods and to ferret out the source of any discrepancy: nor was ever any uncertainty left except that unavoidable in the last place.

Having given this short account of the general object and management of the work, I may now proceed to describe more in detail the actual mode of procedure.

[3]In fact, Callet's tables [10] (published in 1795) contain a table giving the 11th to 61st decimals of the logarithms of primes up to 1097. This table may have been copied from Hutton [20], but both tables actually were first published by Sharp in 1706 [70].

Throughout the whole operation our object is to obtain the greatest number of useful results from a given amount of labour: and it is in this respect alone that any particular notice has to be taken of our procedure since the general principles of the calculation are simple and perfectly well known to every algebraist.

Merely for the sake of completeness the first pages are devoted to the computation of the neperian logarithm of 10, and this is accomplished by means of the single divisor 9, thus

$$3\,\text{nep. log}\,\frac{1+\frac{1}{3}}{1-\frac{1}{3}} = \text{nep. log}\,8 \quad = 2\left\{1+\frac{1}{3}\cdot\frac{1}{9}+\frac{1}{5}\cdot\frac{1}{9^2}+\frac{1}{7}\cdot\frac{1}{9^3}+\text{etc.}\right\}$$

$$\text{nep. log}\,\frac{1+\frac{1}{9}}{1-\frac{1}{9}} = \text{nep. log}\,\frac{10}{8} = 2\left\{\qquad\frac{1}{9}+\qquad\qquad\frac{1}{3}\cdot\frac{1}{9^3}+\text{etc.}\right\}$$

whence

$$\text{nep. log}\,10 = 2+\frac{2}{9}\left(1+\frac{1}{3}\right)+\frac{2}{9^2}\left(\frac{1}{5}\right)+\frac{2}{9^3}\left(\frac{1}{3}+\frac{1}{7}\right)+\frac{2}{9^4}\left(\frac{1}{9}\right)+\text{etc.}$$

whence the well known values of nep. log 10 and of M at once result.

The basis being thus laid, the calculation thereafter proceeds much in the usual way, the computation of $\log\overline{n+1}$ and $\log\overline{n-1}$ being generally combined in the earlier part: but in the more advanced part of the work where the divisors of that one with which our immediate business does not lie, are of difficult discovery, that computation is omitted. A list, however, of all divisors that have been used was regularly kept so that it might readily recurred to: a precaution which the numerous "see p. so and so" sufficiently show to be advantageous.

From the arrangement of the earlier part of the work, it necessarily happened that the logarithms thus found belonged to primes out of order, and sometimes even beyond the intended range of the table: in the latter case a list was kept of the extra primes thus found. Sometimes also it occurred that the number whose logarithm was found was a composite number none of whose factors had yet been happened upon: of these also a list was kept that they might be employed as occasion required.

The great matter at all times was to obtain some multiple of the prime in hand which might differ by unit from some large

number whose logarithm is already known; at the same time that the division by this number is easily performed. Now when any number is terminated by a succession of cyphers the division by it is so much facilitated, hence it is desirable to find those multiples of the prime which end in ... 999 or in ... 001. The operation for this purpose will be best understood from a specimen.

Suppose that we wish to compute the logarithm of the prime number 1619. Of this the first multiple ends in 9: now its penult is 1 wherefore if we add that multiple which ends in 80, that is the twentieth, we shall have a multiple ending in 99; in fact $21 \times 1619 = 33999$. As the antepenult is also 9, the third figure of the multiplier must be 0 while to bring the next figure 3 up to 9 we must add the fourth multiple. The work is arranged as under

						1										1	619		
						2										32	38		
						21										33	999		
					4	0									6	476			
					4	021									6	509	999		
				1										16	19				
			7									1	133	3					
		6										9	714						
	7										113	33							
	76	714	021								124	199	999	999					

In a way exactly similar those multiples which end in ... 001 may be found, but it is manifest that the two sets of multipliers are complementary to each other[4] whence we conclude that $23\,285\,979 \times 1619 = 37\,700\,000\,001$.

From the very nature of the operation it follows that the number preceding the cyphers or the nines is less than the proposed prime,[5] so that its logarithm may be assumed as known: there is then no trouble on this score: but it remains for us to decompose the multiplier.

[4] We have $100\,000\,000 - 76\,714\,021 = 23\,285\,979$.

[5] In the above example, 1241 is smaller than 1619, because the product of 1619 by a 8-digit integer necessarily is smaller than 1619×10^8. And since $377 = 1619 - 1241 - 1$, the number preceding the 0s is also smaller than the proposed prime.

For effecting this decomposition I have had habitual recourse to Burckhardt's Table des Diviseurs which goes a little above three millions.[6]

The number 76 714 021 is however far beyond the limits of Burckhardt. I therefore content myself with trying it by the easy primes 3, 7, 11, 13, 37, and as none of these are divisors I strike off the 7, and would try 6 714 021; but for the sake of obtaining as large numbers as possible I take first the complement 23 285 979 and on trial at once find it divisible by 9, the quotient being 2 587 331 which is within the range of Burckhardt: on turning to that work we find the divisor 167 but the quotient 15493 is prime: this multiple then will not suit us. Taking up the above 6 714 021 we find it resolved into $3 \cdot 1493 \cdot 1499$; so that in all $10\,869\,999\,999 = 3 \cdot 1493 \cdot 1499 \cdot 1619$.

Since we require two independent computations we must seek for another multiple. The next multiplier 3 285 979 is just beyond the table of divisors; it refuses the tests for 3, 7, 11, 13, 37; the labour of an independent examination for its factors might exceed the whole trouble of computing the logarithm and therefore I leave it to take up 714 021; this at once yields to division by 3, and gives $1\,155\,999\,999 = 3 \cdot 7 \cdot 11 \cdot 11 \cdot 281 \cdot 1619$. We have now obtained two numbers sufficiently large, from each of which we may deduce $\log 1619$; but on referring to the number 1499 we find that its two multiples are 2 249 999 and 748 001, the latter of which particularly is small;[7] hence it would be preferable if we can find another convenient multiple of 1619, to compute the logarithm of that number previous to 1499. Now 285 979 is a prime number but $85\,979 = 127 \cdot 677$; whence $139\,200\,001 = 127 \cdot 677 \cdot 1619$.

I therefore decide on computing (as is done in p. 179)[8] the logarithm of 1619 from the two equations[9]

$$1\,155\,999\,999 = 3 \cdot 7 \cdot 121 \cdot 281 \cdot 1619$$
$$139\,200\,001 = 127 \cdot 677 \cdot 1619$$

[6] See [8].

[7] Here, Sang does not want to use the equation $748\,001 = 499 \cdot 1499$ for computing $\log 1499$, because 748 001 is too small. Instead, he prefers to compute $\log 1619$ from other primes, and compute $\log 1499$ from $\log 1619$.

[8] Sang did not give the page number, and only left a blank space to be filled. Page 179 does indeed contain this computation.

[9] In the second equation, Sang, or whoever copied the values, mistakenly wrote 139 000 000 instead of 139 200 001.

and thereafter[10] that of 1499 from

$$10\,869\,999\,999 = 3 \cdot 1493 \cdot 1619 \cdot 1499$$
$$2\,249\,999 = 19 \cdot 79 \cdot 1499$$

Although the description of this process be somewhat prolix, the actual work is by no means tedious; the less so when a great number of products are prepared at once.

Sometimes it is impossible to find very large multiples, but in general when the multiple falls under one million I have tried, by changing the order of the primes to find a better: thus for 1669 we find[11] $106\,099\,999 = 151 \cdot 421 \cdot 1669$ and $952\,999 = 571 \cdot 1669$; but among those rejected there was one[12] containing the factor 8609, wherefore for the purpose of obtaining $\log 1669$ I seek the decomposable multiples of 8609: these are $8\,336\,000\,001 = 3 \cdot 343 \cdot 941 \cdot 8609$ and $587\,900\,001 = 3 \cdot 13 \cdot 17 \cdot 103 \cdot 8609$; but here it is to be remarked that 5879 is a prime whose logarithm is not yet found; wherefore we must yet farther derange the order. On trial we obtain

$$69\,300\,000\,001 = 31 \cdot 37 \cdot 43 \cdot 239 \cdot 5879$$
and
$$48\,279\,999\,999 = 3 \cdot 7 \cdot 11 \cdot 73 \cdot 487 \cdot 5879$$

both of which are unobjectionable;[13] whence, after having computed $\log 5879$, we readily obtain 8609, and thence again from the equation $272\,999\,999 = 19 \cdot 8609 \cdot 1669$, we get $\log 1669$.

These examples will serve to give an idea of those considerations which have influenced the choice of the particular order in which the primes have been taken: the general progress has been onwards in the order of magnitude, the deviations having been made for the sake of obtaining large divisors. The search for these little ameliorations proves a grateful variety in the midst of what otherwise would be a dreary monotony.

The logarithms of the primes were inserted in a table previously arranged solely for the prime numbers; and also in a complete table prepared up to 10 000: at the same time the logarithms of

[10] Pages 179–180.

[11] Sang's manuscript wrote 106 999 999 instead of 106 099 999 and 951 999 instead of 952 999.

[12] This was the equation $272\,999\,999 = 19 \cdot 8609 \cdot 1669$ given below, and it was rejected because $\log 8609$ had not yet been computed.

[13] By that, Sang means that the left-hand values are sufficiently large, and that the computation of $\log 5879$ would not involve yet uncomputed logarithms.

their multiples were found by help of a few slips of paper on the edges of which the logarithms of the earlier natural numbers were written.

2.2 The need for special computations

In his introductory notice, Sang alludes to the logarithms which may be in doubt. The uncertainties on the logarithms to 15 places from 100000 to one million requiring special computations are in fact the following ones, where the figures ranging from 499995 to 500005 are marked in bold:

n	$\log n$
152037	5.181949291**499996**0645...
194854	5.289709325**500004**6387...
401819	5.604030468**499997**5625...
436059	5.639545254**500001**3023...
457585	5.660471779**499999**9770...
627943	5.797920223**499995**1054...
722523	5.858851676**499990**0265...
766146	5.884311538**499996**2014...
770450	5.886744459**500003**7970...
972218	5.987763657**500000**0360...

[14] See [52].

For these values of n, the uncertainties on the 15th place digits may cause the 9th place digits to be computed erroneously. In fact, Sang would have only considered those logarithms whose last six figures, on 15 places, lie between 499998 and 500002, and there are only four such cases, which is nearly the amount anticipated by Sang. Given that Sang only pushed his calculations up to 370000, it is possible that he didn't meet any of these uncertainties. On the other hand, a computation such as that of $\log 152037$ may have been off by two units in the 15th place, leading Sang to do a special computation. Assuming that the 15th place found by Sang is off by at most 3 units with respect to the exact figure, any one of the above cases may have triggered a recomputation, as any value between 499995 and 500005, assuming a ± 3 uncertainty, can fall in the range [499998–500002].

If on the other hand Sang had pushed the computation one digit further, he would only have had to consider at most two uncertainties, namely

n	$\log n$
457585	5.660471779**499999**770...
972218	5.987763657**500000**360...

but locating these two cases would have cost him the writing out of three million digits, and probably years of computations.

2.3 The first computations in volume 1

Figures 1 to 5 illustrate the computations in volume 1. For instance, page K1/6 (figure 1) starts with the computation of the expansion of $\log(1+x)$ with $x = 1/10$. The sums of the odd and even terms $P(x)$ and $N(x)$ are computed separately so that $\log(1+x) = P(x) - N(x)$. $P(x)$ is computed up to $Mx^{25}/25$ and $N(x)$ up to $Mx^{26}/26$, with $M = 1/\ln 10$. Consequently, Sang obtains $\log(11)$.

Then Sang computes $P(x) + N(x) = 1 - \log 9$, from which he deduces $\log(9)$, and then $\log 3 = \log 9/2$, as well as $\log(81) = 2\log 9$.

Sang continues by considering $x = 1/80$ and using the value just computed of $\log 81$, he obtains $\log 80$. $P(x) + N(x)$ gives him $\log 79$.

From $\log 80$, Sang obtains $\log 2$. And from $\log 10$ and $\log 2$, Sang derives $\log 5$.

Then Sang can compute $\log 2400$, and taking $x = 1/2400$, he derives $\log 2399$ and $\log 2401 = \log(7^4)$, which leads to $\log 7$. And so on.

Figure 4: An excerpt from volume K1 (cont'd). Now, Sang considers $x = 1/2400$ and gives the first values of Mx^n, then computes $P(x)$, $N(x)$ and their sum and difference. From this he obtains $\log 2401$ and $\log 2399$, as well as $\log 7$. In the margin, Sang remarks that he should first have considered $x = 1/240$.

2.4 Lists of divisors and primes

On pages 226-229 of volume 1 (figure 6), Sang lists a number of "divisors" and their decompositions. What Sang calls "divisors" are those large values that will be decomposed into primes, although the divisions will actually be made with off-by-one such divisors. For instance, on page 226, the first "divisor" is 698 000 001 when in fact there will be a division by 698 000 000.

The "divisors" on these four pages seem to be those enabling the computation of logarithms of primes between 2000 and 10000, and they are given in the order of these primes. However, not all primes between 2000 and 10000 had their logarithms computed here.

Some of the divisors have references to the pages where they appear, but some of these references appear to be incorrect. For instance, for 2 199 999 999 a penciled note refers to page 103, but on page 103 one finds the decomposition of 21999. 2 199 999 999 actually appears on page 302. Some of these references may have been added later, perhaps by Knott.

On pages 229–230 (figure 7), Sang gives the list of large primes (beyond 10000) for which logarithms have been computed so far. The first prime in the list is 11579 whose logarithm was computed on page 104. The prime 17027 had its logarithm computed on page 71, as we saw earlier (figure 5). The last one in the list is 2 999 999 whose logarithm was computed on page 41. The pages 231-240 give a few more divisors. *

At the end of volume 1 (figure 8), Sang lists on 48 pages the primes from 2 to 10627 and gives the logarithms to 28 places for the primes 2 to 10037, as well as for 10091, 10333, 10393, 10559 and 10601.

Figure 8: The primes from 1741 to 1951 and their logarithms.

3 Volume 2 (K2)

This volume spans from page 241 to 536. It contains the computations of the logarithms of all the primes between 2000 and 10000 not computed in volume 1.

For example, page K2/242 (figure 9) shows a computation of $\log 2011$ and two computations of $\log 2017$. For the first computation of $\log 2017$, Sang considers $n = 1\ 340\ 000\ 000$ and writes $\frac{n+1}{9 \cdot 97 \cdot 761} = 2017$.

Sang gives a reference to page 189, which contains the decomposition for $n = 670\ 000\ 000$ which could be reused here.

Then, Sang computes the development of $\log\left(\frac{n+1}{n}\right) = \log\left(1 + \frac{1}{n}\right)$:

$$\begin{aligned}
\frac{1}{n} \cdot M &= .00000\ 00003\ 24100\ 35962\ 92924\ 087 \\
\frac{1}{2n^2} \cdot M &= .00000\ 00000\ 00000\ 00012\ 09329\ 700 \\
\frac{1}{3n^3} \cdot M &= .00000\ 00000\ 00000\ 00000\ 00000\ 001
\end{aligned}$$

all values beeing rounded to the 28th decimal place. Incidentally, this shows just how important it is for n to be as large as possible.

Adding the value of $\log n$, which is obtained from that of $\log 67$ known since page 19, Sang obtains

$$\log(n+1) = 9.12710\ 47986\ 88907\ 98887\ 12299\ 627$$

for which he does not write the characteristic 9. Sang's value is correctly rounded to the 28th decimal place.

Subtracting the logarithms of 873 (9×97) and 761, Sang obtains

$$\log 2017 = 3.30470\ 58982\ 12765\ 43612\ 80880\ 089$$

which is off by one unit of the 28th place.

Another computation is then performed using $n = 71\ 900\ 000$ and considering $\log(n-1)$, from which Sang derives

$$\log 2017 = 3.30470\ 58982\ 12765\ 43612\ 80880\ 091$$

and Sang then averages both values, obtaining the value

$$\log 2017 = 3.30470\ 58982\ 12765\ 43612\ 80880\ 090$$

which is correctly rounded to the 28th place.

Figure 9: An excerpt from volume K2, with the computations of $\log 2011$ and $\log 2017$.

4 Volume 3 (K3)

This volume spans from page 537 to 770. It provides other computations of already known logarithms from page 537 to page 637, as volumes 1 and 2 have already given the logarithms of all primes up to 10000. After page 637, there are two indices.

4.1 An example in volume 3

Page K3/580 (figure 10) starts with the end of the computation of $\log 7603$. Then Sang considers $n = 4029 \cdot 10^4$ which he writes 4029(4). We have $4029 \cdot 10^4 = 5309 \cdot 7589$ and Sang refers to page 206 where $\log 1343$ had been used, which is reused here for the computation of $\log 4029 = \log(3 \times 1343)$.

$\log 5309$ had been computed on page 401, and Sang can therefore derive a value for $\log 7589$. In this case,

$$\begin{aligned}
\log 7589 &= \log\left(\frac{n+1}{n}\right) + \log n - \log 5309 \\
&= \log\left(1 + \frac{1}{n}\right) + \log 3 + \log 1343 + 4 \times \log 10 - \log 5309 \\
&= (\log 3 + \log 1343 + 4 \times \log 10 - \log 5309) + \frac{1}{n} - \frac{1}{2n^2} + \frac{1}{3n^3} + \cdots
\end{aligned}$$

yielding the four terms given by Sang. In that case, Sang's final result is off by 4 places, because the value computed for $\frac{1}{2n^2}$ was off by 3 units of the 28th place. The value of $\log 7589$ was probably compared with those obtained on page 479, and Sang concluded that the present value was off by 4 places, which is written in the margin.

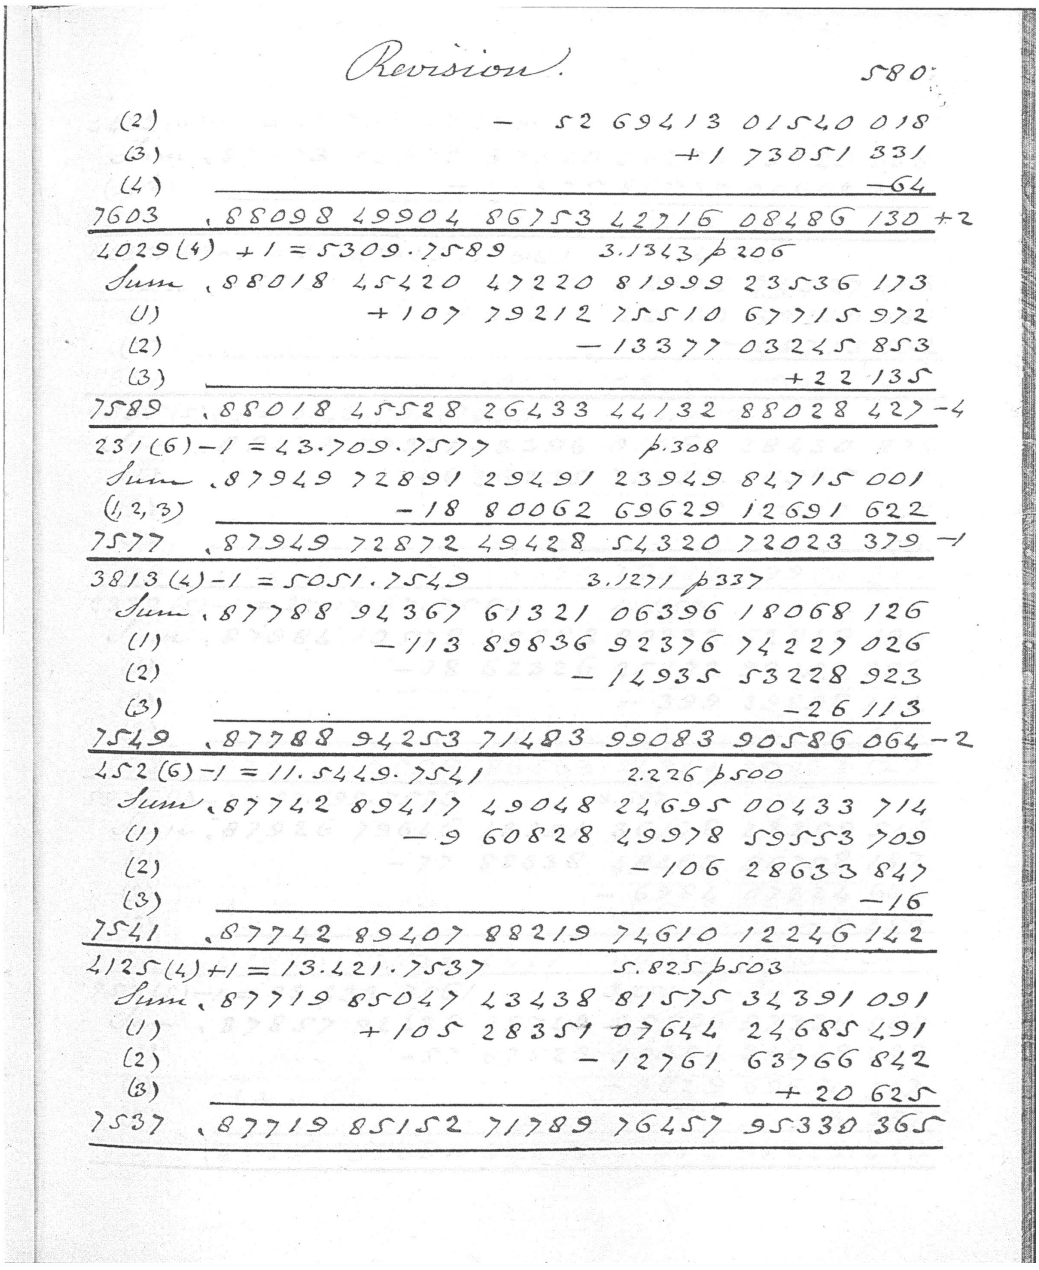

Figure 10: An excerpt of the computations in volume K3.

4.2 The indices to divisors and primes

Volume K3 ends with two indices, one to divisors (pages 638–728), and one to primes (pages 729–770) involved in the various computations of the first three volumes K1, K2 and K3. These indices have not been reconstructed, but my reconstruction of (most of) the computation steps should for the moment suffice to analyze Sang's construction. *

4.2.1 The index to divisors

This index lists the values of n used in computing logarithms. For instance, page 697 (figure 11) lists the value 3767 and shows that $n = 3767 \cdot 10^6$ was used on page 554. The entry "$-$" indicates that the decomposition of $n - 1$ was used and is equal to $7 \cdot 7 \cdot 31 \cdot 271 \cdot 9151$. This decomposition was used to compute $\log 9151$.

The value 3785, for instance was used on page 393 in the decomposition $3785 \cdot 10^7 + 1 = 3 \cdot 11 \cdot 37 \cdot 5081 \cdot 6101$, from which $\log 5081$ was obtained. Moreover, $3785 = 5 \cdot 757$. The factor 5081 is underlined because its logarithm is derived and it is not the greatest factor. In general, the decompositions are used to derive the logarithms of the greatest factors.

4.2.2 The index to primes

The index to divisors is followed by an index to primes. For each prime, Sang lists the divisors which have been used to compute it. For instance, on page 761 (figure 12), the prime 7349 was obtained by three different computations, one involving $n = 6211 \cdot 10^6$ (page 461), a second one involving $n = 1138 \cdot 10^6$ (also page 461), and a third one involving $n = 3318 \cdot 10^5$ (page 583). The index to divisors can be used to locate the computations. Most primes have been computed by three independent decompositions, but some, such as 7351, have been computed four times, or rather, have been involved in four independent computations. 7351, for instance, was computed three times using $n = 111 \cdot 10^4$ (page 54), $n = 5594 \cdot 10^7$ (page 260), and $n = 4483 \cdot 10^6$ (page 581), but it was also involved as a divisor $n = 7351 \cdot 10^6$ (page 404) for the computation of $\log 9007$.

Some of the primes have actually only been computed twice, for instance 9007 ($n = 7351 \cdot 10^6$ on page 404, $n = 1656 \cdot 10^6$ on page 556), but this prime also appears in the decompositions of $n = 1967 \cdot 10^7$ (page 405) and $n = 5533 \cdot 10^4$ (page 600). It is possible that the index to primes gives these references, but I have not checked it. *

5 Timeline

Throughout Sang's volumes, there are several recapitulations on the progress of the computations.

As mentioned earlier, Sang states at the end of the introductory notice in volume K1 that his work was begun in December 1848 and that the logarithms of all the primes up to 2000 were completed at the end of July 1865.

On page 146 of volume K1, after the computation of log 1097, there is also a note dated September 20, 1853: "This completes the revision (to 25 places) of Callet's table to 61 places. Thus far no error has been found. Henceforth each prime must have its logarithm computed twice."

On page 208, there is the date "8 sept. 1854." On page 209, "4 april 1859." On pages 210 and 211, "5 april 1859." On page 212, "6 april 1859." On page 225, "31 July 1865."

In volume K2, Sang has a note dated 26 January 1875 stating that the computations were begun in August 1865 and completed in September 1874.

On page 274 of that volume, there is the date "26 May 1871." And on page 276, "3 June 1871." On page 279, "4 June 1871."

We also know from the specimens Sang published in 1872 [58] that he had by then computed the logarithms of all primes up to 2600, which is here around page 300.

Next on page 326, we find the date "2 April 1874." On page 390, after the computation of log 4973, Sang writes "This completes the prime numbers up to 5000, 8 June 1874." Indeed, the logarithms of the primes 4987, 4993, 4999 had been computed earlier.

On page 425, there is the date "5 July 1874."

This volume ends with the date "21 September 1874." There is also the note "Index 21 October 1874" which may refer to the index in volume K3.

In volume K3, Sang writes that the computations were begun in October 1874 and that this volume was completed on the 9th of January 1875.

On page 586, Sang mentions that on that day there was a transit of Venus (9 December 1874).

On page 636, Sang has the note "This completes three combinations, at the least, for each prime number under ten thousand. 29 December 1874."

And on page 637, the final date is "30 December 1874."

6 The computation order of the primes

All prime numbers up to 10037, as well as a few others greater than 10037, appear in the construction volumes K1, K2 and K3.

If one considers the order of the first appearances of the logarithms of the primes under 10000 in the first two construction volumes (K1 and K2), one obtains the following list of primes:

3, 11, 79, 2, 5, 2399, 7, 37, 13, 19, 401, 2423, 17, 23, 43, 29, 31, 53, 41, 109, 211, 61, 67, 47, 89, 59, 277, 347, 281, 1439, 71, 73, 107, 83, 163, 97, 197, 101, 137, 263, 113, 2633, 7901, 1549, 103, 421, 127, 2963, 863, 239, 241, 233, 2243, 6469, 271, 9091, 4649, 199, 181, 641, 1087, 2999, 3001, 1579, 2521, 491, 3253, 8999, 9001, 139, 269, 631, 7541, 1913, 4889, 311, 461, 547, 131, 229, 823, 811, 149, 8111, 1973, 1423, 887, 883, 2753, 151, 157, 7351, 2293, 293, 499, 167, 4999, 1667, 2381, 173, 179, 853, 3517, 1747, 2207, 191, 1889, 4363, 3089, 6911, 3617, 1453, 797, 647, 193, 1019, 317, 991, 457, 1069, 223, 967, 617, 1381, 4111, 227, 839, 6299, 6301, 251, 9403, 257, 1801, 439, 383, 8867, 283, 2143, 2459, 7109, 307, 313, 379, 809, 1409, 1033, 331, 9601, 5647, 9199, 3067, 467, 337, 1181, 7499, 577, 359, 2027, 419, 349, 857, 353, 2069, 1373, 367, 431, 503, 6037, 373, 3499, 389, 1129, 3889, 2477, 3533, 397, 2267, 2711, 409, 643, 1493, 2647, 4091, 3719, 5689, 1307, 433, 1301, 619, 2549, 1831, 443, 1693, 7561, 3433, 7333, 449, 683, 5641, 1877, 1291, 463, 751, 479, 1823, 487, 5323, 3299, 3301, 541, 9901, 521, 1523, 613, 509, 4637, 2777, 523, 1283, 1193, 7283, 557, 2693, 2099, 563, 1123, 8933, 569, 947, 7507, 1609, 571, 673, 587, 3011, 661, 593, 4241, 829, 601, 599, 821, 607, 2137, 1249, 653, 659, 677, 691, 701, 709, 1021, 719, 727, 733, 739, 743, 3607, 1187, 757, 761, 769, 773, 787, 1753, 9679, 827, 859, 877, 881, 907, 911, 919, 929, 1697, 937, 941, 953, 971, 977, 983, 997, 1009, 1013, 1031, 1039, 1049, 1051, 1061, 1063, 1091, 1093, 1097, 1103, 2309, 1109, 4153, 1117, 2617, 2179, 1151, 1153, 1163, 1171, 8861, 1201, 4273, 1213, 3121, 1217, 1223, 1229, 2741, 1231, 1237, 1259, 1277, 1279, 6311, 1289, 1297, 2089, 1303, 1319, 2591, 1321, 1789, 7307, 1327, 1361, 1367, 9689, 1399, 2383, 1427, 1429, 1433, 1447, 1451, 1459, 1471, 6961, 1993, 1481, 1483, 1487, 1489, 1619, 1499, 1511, 1531, 3947, 1543, 3163, 1553, 2791, 4243, 9871, 5791, 1559, 1567, 1571, 1583, 6343, 6217, 1597, 1601, 1607, 1613, 1621, 1627, 1637, 1657, 1663, 5879, 8609, 1669, 1699, 1777, 1709, 1721, 1723, 1733, 3251, 5749, 7079, 4327, 4957, 1741, 2707, 2287, 5501, 1759, 2237, 1783, 5147,

This sequence is represented graphically in figure 13. The abscissa ranges from 1 to 1229, as there are 1229 primes from 2 to 9973. The highlighted value corresponds to the 43rd computed logarithm, which is $\log 7901$. What this figure shows is that the logarithms were mostly computed in quasi-ascending order, with occasional computations of higher values. Sang has tried as much

as possible to avoid gaps. However, we can see a strange gap between the computation of $\log 2017$ (422nd value computed) and $\log 2029$ (459th value computed). Between these two computations, which occured on pages 242 and 268, Sang computed the logarithms or 36 other primes, all greater than 2017. The first of these primes was 3881. It remains to see why Sang felt the need to introduce this break. It is possible that a number of divisors had been computed separately and were shuffled in at this stage. *

7 The encoding of the computation steps

7.1 Recording the steps

In order to give a good account of Sang's steps for the computation of the logarithms of primes, I have made extensive recordings of the original volumes. For instance, for pages 66 to 73 in volume K1, I took a number of compact notes (figure 14).

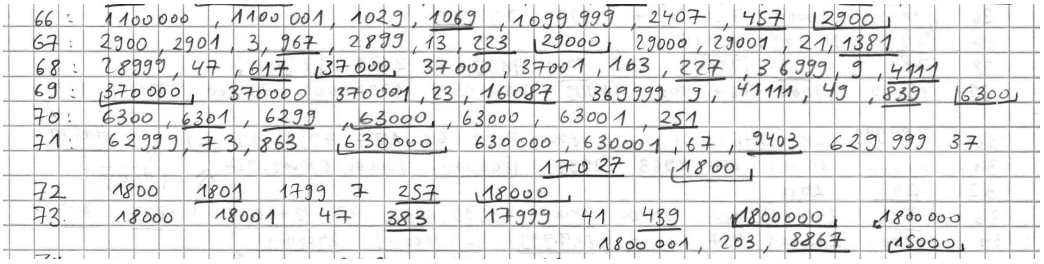

Figure 14: A first excerpt from my notes for volume K1.

I took in fact a total of 36 pages of handwritten notes and these notes were then standardised in a mere text file. For instance, for page 71 (figure 5), we have the following lines (the text file actually had one value per line, but I give here a compacted version):

```
71
  62999 73 863 D630000 630000 630001 67 9403 629999 37 17027 D1800
```

This reads as follows: on page 71, the logarithms of 62999, 73, 863, etc., are given. Values starting with "D" correspond to divisors, so that $n = 630000$ and $n = 1800$ are used on that page. In the above excerpt, divisors are underlined by square brackets, whereas newly found logarithms of primes are underlined with straight lines. These steps have been recorded until page 218, when, for lack of time, a less complete procedure was devised. *

After page 218, I have only recorded the divisors and the primes directly derived from them. For instance, for page 334, I only took the following notes (figure 15):

```
334
  1518(5):3413 248(7):3449 2792(5):3449 541(8):3457 2245(6):3457
```

This means that on page 334 the value $n = 1518 \cdot 10^5$ is considered, and either $n + 1$ or $n - 1$ contains the factor 3413, and similarly for the other cases.

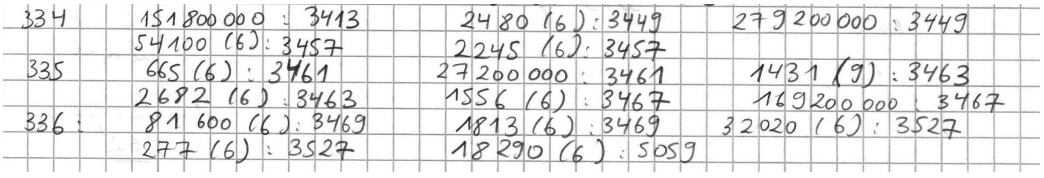

Figure 15: A second excerpt from my notes for volume K1.

Finally, in order to trace the steps of the computation, I have kept track of which logarithms had already been computed, and hence which ones were known and which ones were obtained by a given divisor. However, in a few instances my recording was not sufficient, and I have therefore "forced" some logarithms to be known. For example, my typed recording of the first pages reads:

```
6
  D10
7
  11 9 3 81 D80
8
  81 79 *2 *5 2400
9
  D2400 2401 2399 7
```

This means that on page 6, $n = 10$ is considered, on page 11 the logarithms of 11, 9, 3 and 81 are given, and then Sang considered $n = 80$. On page 8, Sang gave the logarithms of 81, 80 (which I did not record), 79, 2, 5, and 2400. I have "forced" the logarithms of 2 and 5 to be known, so that the later steps can take them into account. This was encoded by asterisks. This was necessary because the initial step involves using the logarithm of 10, which is not prime. Most likely, $\log 2$ was then computed from $\log 80$ and $\log 10$, and $\log 5$ was computed from $\log 10$ and $\log 2$. Such "tweaking" was used in a few other instances.

This encoding then was used to produce a "readable" version of my notes. For page 8, this readable version reads:

page 8:
    log(81)=log(3^4) [log(3) known]
    log(79)=log(79) [log(79) known]
    log(2)   (assumed to be known now)
    log(5)   (assumed to be known now)
    log(2400)=log($2^5 \times 3 \times 5^2$) [log(2) log(3) log(5) known]

This means that page 8 gives the logarithm of 81 (computed using the logarithm of 3), the logarithm of 79 (which is computed here and then considered known), the logarithms of 2 and 5 (which are forced to be known), and finally the logarithm of 2400 which is obtained from three other known logarithms. In all these transcriptions, whenever a number appears on the right-hand side of an equation, it is decomposed into its factors. Hence, `log(79)=log(79)` means that 79 is a prime number.

For page 71, the "readable" transcription is:

```
page 71:
    log(62999)=log(73 × 863) [log(73) log(863) known]
    log(73)=log(73) [log(73) known]
    log(863)=log(863) [log(863) known]
  decomposition(630000)
      630000-1=37 × 17027
      630000+1=67 × 9403
         → allows the comp. of log(9403)
    log(630000)=log(2^4 × 3^2 × 5^4 × 7) [log(2) log(3) log(5) log(7) known]
    log(630001)=log(67 × 9403) [log(67) log(9403) known]
    log(67)=log(67) [log(67) known]
    log(9403)=log(9403) [log(9403) known]
    log(629999)=log(37 × 17027) [log(37) known]
    log(37)=log(37) [log(37) known]
    log(17027)=log(17027)
  decomposition(1800)
      1800-1=7 × 257
         → allows the comp. of log(257)
      1800+1=1801
         → allows the comp. of log(1801)
```

Here, the logarithm of 62999 is computed from the logarithm of 73, known since page 23, and the logarithm of 863 also known. These two logarithms are then given, then $n = 630000$ is considered and $n-1$ and $n+1$ are decomposed, which allows for the computation of the logarithms of 17027 and 9403. Only logarithms smaller than 10000 are recorded in my procedure, which explains that I did not highlight the derivation of the logarithm of 17027. This also explains why for instance the logarithm of 629999 is given, but that I only stress that the logarithm of 37 is known.

Although not perfect, I believe that this readable version will make it much easier to go through Sang's construction.

After page 218, my readable version is simpler, since I only record the divisors and the primes obtained from them, for instance here for page 334 (figure 15):

page 334:

$\Rightarrow \quad 1518 \times 10^5 + 1 = 79 \times 563 \times 3413$

$\longrightarrow$ This equation enables the computation of log(3413)

$\Rightarrow \quad 248 \times 10^7 + 1 = 3 \times 17 \times 23 \times 613 \times 3449$

$\longrightarrow$ This equation enables the computation of log(3449)

$\Rightarrow \quad 2792 \times 10^5 - 1 = 13^2 \times 479 \times 3449$

$\longrightarrow$ This equation enables the computation of log(3449)

$\Rightarrow \quad 541 \times 10^8 - 1 = 3^2 \times 19 \times 23^2 \times 173 \times 3457$

$\longrightarrow$ This equation enables the computation of log(3457)

$\Rightarrow \quad 2245 \times 10^6 - 1 = 3 \times 11^2 \times 1789 \times 3457$

$\longrightarrow$ This equation enables the computation of log(3457)

7.2 Special derivations

As alluded above, a number of logarithms have been derived in such a way as to make it difficult to guess how they were derived by merely looking at the notes I took. The problem does not always lie in my incomplete notes, but may be due to Sang not detailing everything. For instance, on page 87 Sang gives $\log 367$ which has been computed using $\log 108999$ and $\log 297$, but he nowhere gives the value of $\log 108999$.

Since the knowledge of the order of the logarithms is important for later guesses, a number of logarithms have been "forced" to be known in my procedure. The corresponding cases up to page 218 are the following, with uncertainties marked:

- page 8: $\log 2$ was probably computed with $\log 2 = (\log 80 - \log 10)/3$, then $\log 5 = 1 - \log 2$; *

Further uncertainties have not been recorded but should be recorded in the future. *

8 What remains to be done

1. As mentioned above, I have not made a detailed record of all the steps from pages 219 to 637 (volumes K2 and K3), but I only wrote down the divisors considered by Sang and the primes he derived from them. Sang may have given the logarithms of other numbers in the course of these derivations, and these values should be recorded. This should now be very easy, as one merely has to take my reconstruction and add the missing informations at the corresponding places. In the future, a more accurate reconstruction can then be provided.

2. Other than that, a few derivations should again be examined carefully (see the ✻ marks for pages 8, 18, 48, 138, 162 and 188).

3. Page ranges should also be checked for each volume.

4. During the analysis of the notes I took of Acc 10780/16, 17 and 18, I also found some typos, and I have recorded some of those concerning Acc 10780/17 (K2) and 18 (K3). Some of these typos are probably typos in the original volumes, and this should be checked. For each of these typos, I have copied a large number n and a prime p, the logarithm of the prime being obtained either from that of $n-1$ or $n+1$ and from other logarithms. The table below gives the correct values of n and the primes p, with possible uncertainties underlined. For instance, 7$\underline{3}$5(7) represents $735 \cdot 10^7$, but Sang's manuscript may have another digit instead of 3. There may also be typos in the number of zeros, that is, in the power of 10. When nothing is underlined, both values should be checked.

5. The indices of divisors and primes should also be reconstructed, although they are not indispensable with the search tools of the digital reconstruction.

9 References

The following list covers the most important references[15] related to Sang's table. Not all items of this list are mentioned in the text, and the sources which have not been seen are marked so. I have added notes about the contents of the articles in certain cases.

[15] **Note on the titles of the works:** Original titles come with many idiosyncrasies and features (line splitting, size, fonts, etc.) which can often not be reproduced in a list of references. It has therefore seemed pointless to capitalize works according to conventions which not only have no relation with the original work, but also do not restore the title entirely. In the following list of references, most title words (except in German) will therefore be left uncapitalized. The names of the authors have also been homogenized and initials expanded, as much as possible.

The reader should keep in mind that this list is not meant as a facsimile of the original works. The original style information could no doubt have been added as a note, but I have not done it here.
