Introduction

Edward Sang (1805–1890) was probably the greatest calculator of logarithms of the 19th century [5, 16, 17, 18, 30, 42]. Sang spent 40 years computing tables of logarithms and trigonometric functions, with the assistance from his daughters Flora (1838-1925) and Jane (1834-1878). The result fills about 50 manuscript volumes, plus a number of transfer duplicates, which are kept at Edinburgh University Library and at the National Library of Scotland, Edinburgh. I have reconstructed a number of these tables and an overview of the tables and reconstructions can be found in a separate guide [49].

Sang’s purpose was in particular to provide fundamental tables, including for the decimal division of the quadrant. In 1890 [5, p. 189], he wrote that

In addition to the results being accurate to a degree far beyond what can ever be needed in practical matters, [the collection of computations] contains what no work of the kind has contained before, a complete and clear record of all the steps by which those results were reached. Thus we are enabled at once to verify, or if necessary, to correct the record, so making it a standard for all time.

For these reasons it is proposed that the entire collection be acquired by, and preserved in, some official library, so as to be accessible to all interested in such matters; so that future computers may be enabled to extend the work without the need of recomputing what has been already done; and also so that those extracts which are judged to be expedient may be published.

The present volume K43 gives the logarithmic sines and cosines.¹

1 Direct computation of the logarithms of sines

Before Sang worked on the computation of volume K43, he gave a procedure for computing the logarithms of sines in an article published in 1884 [78]. I am summarizing this article here.

Sang recalled that the first tables of logarithms of sines were computed from the sines, in particular by Napier [36, 37, 38, 40, 39, 47]. He stresses that if the computations can be done less laboriously without resorting to the sines, it should be adopted.

Sang refers to formulæ in Jean-François Callet’s 1795 edition of his *Tables portatives* [15, p. 48]. Callet² starts with the series

$$\cos a = 1 - \frac{a^2}{2!} + \frac{a^4}{4!} - \frac{a^6}{6!} + \dots$$

¹National Library of Scotland, Edinburgh, Acc.10780/53.

²Callet, 1744-1798, see Lalande’s *Bibliographie astronomique ; avec l’histoire de l’astronomie depuis 1781 jusqu’à 1802*, 1803, p. 804-805.

and if a is replaced by $q = \frac{\pi}{2}$, $\cos a = 0$. Consequently the series is divisible by $1 - \frac{a}{q}$. But since $\cos(-q) = 0$, the series is also divisible by $1 + \frac{a}{q}$, and therefore by $1 - \frac{a^2}{q^2}$. And since $\cos(3q) = \cos(-3q) = \cos(5q) = \dots = 0$, we obtain

$$\cos a = \left(1 - \frac{a^2}{q^2}\right) \left(1 - \frac{a^2}{3^2q^2}\right) \left(1 - \frac{a^2}{5^2q^2}\right) \left(1 - \frac{a^2}{7^2q^2}\right) \dots$$

Similarly, one obtains

$$\sin a = a \left(1 - \frac{a^2}{2^2q^2}\right) \left(1 - \frac{a^2}{4^2q^2}\right) \left(1 - \frac{a^2}{6^2q^2}\right) \dots$$

Taking the logarithms of these sums, and expanding $\ln(1-x) = -x - \frac{x^2}{2} - \frac{x^3}{3} - \dots$, we obtain series for $\ln \sec a$ and $\ln \frac{a}{\sin a}$. Unfortunately, these series converge very slowly.³

Sang observes that although Callet's result is correct, his reasoning is faulty and essentially takes for granted that the quotient of $\cos a$ by the product of $(1 - \frac{a^2}{q^2})(1 - \frac{a^2}{3^2q^2}) \dots$ tends to 1, which is not proven.

Then Sang obtains the series for $\ln \sec a$ and $\ln \frac{a}{\sin a}$ directly:

$$\begin{aligned} \ln \sec a &= \frac{1}{2}a^2 + \frac{1}{2^2 \cdot 3}a^4 + \frac{1}{3^2 \cdot 5}a^6 + \frac{17}{2^3 \cdot 3^2 \cdot 5 \cdot 7}a^8 + \frac{31}{3^4 \cdot 5^2 \cdot 7}a^{10} \\ &+ \frac{691}{2 \cdot 3^5 \cdot 5^2 \cdot 7 \cdot 11}a^{12} + \frac{2 \cdot 43 \cdot 127}{3^5 \cdot 5^2 \cdot 7^2 \cdot 11 \cdot 13}a^{14} + \frac{257 \cdot 3617}{2^4 \cdot 3^6 \cdot 5^3 \cdot 7^2 \cdot 11 \cdot 13}a^{16} \\ &+ \frac{73 \cdot 43867}{3^8 \cdot 5^3 \cdot 7^2 \cdot 11 \cdot 13 \cdot 17}a^{18} + \frac{31 \cdot 41 \cdot 283 \cdot 617}{2 \cdot 3^8 \cdot 5^4 \cdot 7^2 \cdot 11 \cdot 13 \cdot 17 \cdot 19}a^{20} + \dots \\ \ln \frac{a}{\sin a} &= \frac{1}{2 \cdot 3}a^2 + \frac{1}{2^2 \cdot 3^2 \cdot 5}a^4 + \frac{1}{3^4 \cdot 5 \cdot 7}a^6 + \frac{1}{2^3 \cdot 3^3 \cdot 5^2 \cdot 7}a^8 + \frac{1}{3^5 \cdot 5^2 \cdot 7 \cdot 11}a^{10} \\ &+ \frac{691}{2 \cdot 3^7 \cdot 5^3 \cdot 7^2 \cdot 11 \cdot 13}a^{12} + \frac{2}{3^6 \cdot 5^2 \cdot 7^2 \cdot 11 \cdot 13}a^{14} + \frac{3617}{2^4 \cdot 3^7 \cdot 5^4 \cdot 7^2 \cdot 11 \cdot 13 \cdot 17}a^{16} \\ &+ \frac{43867}{3^{11} \cdot 5^3 \cdot 7^3 \cdot 11 \cdot 13 \cdot 17 \cdot 19}a^{18} + \frac{283 \cdot 617}{2 \cdot 3^9 \cdot 5^6 \cdot 7^2 \cdot 11^2 \cdot 13 \cdot 17 \cdot 19}a^{20} + \dots \end{aligned}$$

As far as I know, these expressions have not been given before Sang, but Callet expressed the terms as sums of the reciprocals of even powers [15, p. 49]. For instance, for the first series, he basically wrote that

$$\ln \sec a = \sum_{n=1}^{\infty} \left(\sum_{i=0}^{\infty} \frac{1}{(2i+1)^{2n}} \right) \times \frac{2^{2n}}{n\pi^{2n}} a^{2n}$$

or rather he gave a series for $\text{Log} \cos \left(\frac{m}{n} \cdot \frac{\pi}{2}\right)$ where Log is a generic logarithm, and he used k for the modulus (in our case $k = 1/\ln 10$).

Now, using these sums, Sang could write, multiplying the previous values by the modulus $M = 1/\ln 10$:

³Yet, these are the series used by Andoyer for the table of logarithms of sines and tangents published in 1911 [1].

$$\begin{aligned}
\log \sec a &= 0.21714724095162591383 \times a^2 \\
&+ 0.03619120682527098564 \times a^4 \\

&+ 0.00000000005430574190 \times a^{18} \\
&+ 0.00000000000495207566 \times a^{20} \\
&+ \dots
\end{aligned}$$

Callet had given similar series up to the 24th power [15, p. 50]:

$$\begin{aligned}
\text{Log} \cos \left(\frac{m}{n} \cdot \frac{\pi}{2} \right) &= -k \frac{m^2}{n^2} \times 1.233700550136 \dots - \dots \\
\text{Log} \sin \left(\frac{m}{n} \cdot \frac{\pi}{2} \right) &= \text{Log} m - \text{Log} n + k \ln \frac{\pi}{2} - k \frac{m^2}{n^2} \times 0.411233516 \dots - \dots
\end{aligned}$$

where $1.233700550136 \dots = \frac{1}{2} \cdot \frac{\pi^2}{2^2}$, and $0.411233516 \dots = \frac{1}{6} \cdot \frac{\pi^2}{2^2}$, etc.

In Sang's numerical expressions, $0.2171472409516 \dots = \frac{1}{2} \cdot \frac{1}{\ln 10}$, $0.0723824136505 \dots = \frac{1}{6} \cdot \frac{1}{\ln 10}$, and therefore $\frac{1.233700550136 \dots}{0.2171472409516 \dots} = \frac{\pi^2}{2^2} \cdot \ln 10$.

Sang however observed that these series are inconvenient and can only be used with small arcs. He then concluded that using these series "would entail more labour than the simple plan of deducing the logarithm from the sine." He therefore turned to the method expounded in section 3.

2 An additional note from 1885

In a note dated 25 april and 22 may 1885,⁴ Sang gave a scheme for the computation of the logarithms of sines. Sang started with the general formula

$$\sin a = \frac{\sin 2a}{2 \cdot \cos a}$$

and observed that the $\log \sin$ of the lower half of the quadrant can be obtained from the upper half:

$$\sin a = \frac{\sin 2a}{2 \cdot \sin(100^\circ - a)}$$

where 100° is the centesimal angle for the quadrant. Once $\log \sin 100^\circ$ to $\log \sin 50^\circ$ are obtained, the next values $\log \sin 49^\circ$, $\log \sin 48^\circ$, etc., can be obtained with

$$\begin{aligned}\log \sin 49^\circ &= \log \sin 98^\circ - \log 2 - \log \sin 51^\circ \\ \log \sin 48^\circ &= \log \sin 96^\circ - \log 2 - \log \sin 52^\circ\end{aligned}$$

and so on.

Similarly, the values of $\log \tan$ are easily derived, as well as the differences for $\log \sin$ and $\log \tan$. The details are given in the next section.

According to Sang, this process gives more accurate values of $\log \sin$ for small angles, than a direct process.

3 The procedure actually used

A summary of Sang's procedure was given in the account drawn up in November 1890 [5, p. 188], but Sang gave more details in a seven page notice introducing his table of logarithmic sines and tangents.⁵ Sang wrote that

The following tables are founded on the Canon of Sines to fifteen places (1881)⁶ which had been shortened from scroll calculations to 18 places, and which are expected to be true throughout to within 0.503 in the fifteenth place. The logarithms of these sines from $\sin 100^\circ$ to $\sin 50^\circ$ were computed by help of the fifteen-place logarithms of numbers from 100000 to 370000 (1878),⁷ using the auxiliary table (1884).⁸

For this, the actual sines were divided by 3 or by 2 as such might be to bring the quotient within the range of the table, that quotient was then divided by

⁴National Library of Scotland, Edinburgh, Acc.10780/78.

⁵National Library of Scotland, Edinburgh, Acc.10780/53.

⁶These are the tables contained in volumes K41 and K42, see my reconstruction [60].

⁷See the reconstruction of the logarithms of numbers to 15 places [56].

⁸See my reconstruction of the auxiliary table [57].

the number formed of the first six of its digits, and the logarithm of this new quotient was then got directly from the auxiliary table.⁹

Beginning with $99^{\circ}99'$ and descending, the computed logarithms were written, in order, on an aside-paper, their first, second and third differences being taken as the work progressed, and, whenever an irregularity appeared in the third differences, the logarithm was re-computed. Now the logarithmic canon, from the nature of its construction, is liable to an uncertainty of 2, hardly of 3, units in the last place so that our log sines can hardly have an uncertainty of less than 4, or say even 5 units in the 15th place. But a change of 5 in the function causes changes of -5 , $+15$, -15 , $+5$ in the third differences so that if, of two consecutive logarithms, one were 5 in excess, the other, 5 in defect, an error of 30 would appear in the column of third differences; so that an irregularity of less than 30 does not necessarily imply an error in calculation. When occasion arose, the true third difference was computed from the formula¹⁰

$$\Delta^3 \log \sin a = \frac{\cos a}{\sin^3 a} \times 10^{3.5271739}.$$

The aside-paper having been thus filled up, the last differences were carefully inspected, and, whenever it was seen that a change of 1, 2 or even 3 units in the function would improve the sequence of the differences, that change was marked in red ink, as also were the consequent changes in the last column. Thereafter the so corrected functions were copied on the present pages, but the differences were anew computed from the numbers as actually written; in this way a complete check was had on the accuracy of the work. This work was likewise a severe test of the truthfulness of the Canon of Sines and of Logarithms, in which no symptom of an error was found.

The second part of the Canon, that is from 50° to 0, was constructed essentially according to the process used by Nepair for his Wonder-Working

⁹For instance, if we compute $\log \sin 70^{\circ}$, the table of sines gives the value 0.891006524188368, this value is divided by 3 to bring it below 0.370000:

$$\log \sin 70^{\circ} = \log 0.297002174729456 + \log 3$$

But $0.297002174729456 = \frac{0.297002174729456}{297002} \times 297002 = 0.000001000000588\dots \times 297002 = 10^{-6} \times 1.000000588 \times 297002$ and $\log 0.297002174729456 = \log 1.000000588 + \log 297002 - 6$. Then, the auxiliary table gives $\log 1.000000588 = 0.000000255365080$, and eventually $\log \sin 70^{\circ} = 0.477121254719662 + 0.000000255365080 + 5.472759373849331 - 6 = -0.050119116065927$, and $10 + \log \sin 70^{\circ} = 9.949880883934073$, whereas the correct value is 9.949880884069011. The discrepancy is due to the fact that the quotient 0.000001000000588 was truncated. A more accurate value can be obtained by interpolation and we would have to add 0.00000000134935 to the above result, reaching -0.050119115930992 and hence a tabulated value of 9.949880884069008, which is off by 3 units of the 15th place. This does of course ignore the errors in the logarithms of numbers mentioned by Sang below.

¹⁰This somewhat mysterious formula gives an approximation of the third difference in units of the 15th place. It can be established by help of the formulæ used in the computation of the *Cadastre* tables [48, p. 81]. Sang may have used the description of the tables by Lefort [31], or he may have established the results himself. In any case, we have $\Delta^3 \log \sin a \approx 2M(\cot a + \cot^3 a) \times \left(\frac{0.01}{100} \times \frac{\pi}{2}\right)^3$. Observing that $\cot a + \cot^3 a = \frac{\cos a}{\sin^3 a}$ and scaling this expression by 10^{15} , we obtain Sang's formula because $\log \left[2M \left(\frac{0.01}{100} \times \frac{\pi}{2}\right)^3 \times 10^{15}\right] = 3.5271739\dots$

Canon,¹¹ with expedients however, for saving labour and for securing accuracy. The log-sine of any arc less than the half-quadrant may be got from the log-sines in the other half by help of the formula

$$\sin a = \frac{1}{2} \sin 2a \cdot \sec a,$$

and its log-tangent by help of the additional formula

$$\tan a = \sin a \cdot \sec a;$$

Having written the logarithm of $\frac{1}{2}$ on the lower edge of a card, and placed that card in position on the aside-paper, we write below, first the logarithm of the double arc, next the log-secant of the single arc (which is the arithmetical complement of the log-sine of the arc's complement), and the sum of these three is the log-sine of the proposed arc. Again by adding to this the same log-secant, we obtain the log-tangent sought for. Thus, for the arc $42^{\circ}80'$, the computation is as under:¹²

	9.6989	70004	336019	$\log \frac{1}{2}$
85°60'	9.9887	93819	381819	$\log \sin 2a$
57 20	0.1065	76259	114265	$\log \sec a$
	9.7943	40082	832103	$\log \sin a$
42 80	9.9009	16341	946368	$\log \tan a$

If this process alone were followed, each result would be independent of the others, and the only expedient for verification would be by repeating the work; this again would need to be done by another computer in order to avoid the well known risk of falling into the same mistake even after a long lapse of time. Actually these calculations were made only for each tenth minute, in order to serve for verification; the computation from minute to minute being made by help of differences, in the following manner.

In computing downwards, say from $42^{\circ}80'$, we observe¹³ that the difference of the log-sines of $42^{\circ}80'$ and $42^{\circ}79'$, is the sum of the differences for log-sines $85^{\circ}60'$ and $85^{\circ}58'$ and for those of $57^{\circ}20'$ and $57^{\circ}21'$. Now we readily get the former by taking the sum of the two contiguous differences already written in the preceding part of the table, while the latter is to hand. Hence the work is easily arranged as under:¹⁴

¹¹See [36, 37, 38, 40, 39, 47].

¹²I have kept Sang's values, but the last figures are sometimes off by 1. Note that Sang writes the angle $100^{\circ} - 42^{\circ}80'$ left of $\log \sec a = -\log \sin(100^{\circ} - 42^{\circ}80')$.

¹³This follows from

$$\frac{\sin x}{\sin(x - \Delta x)} = \frac{\sin 2x}{\sin 2(x - \Delta x)} \times \frac{\cos(x - \Delta x)}{\cos x}$$

which is easily checked.

¹⁴The column on the right contains the first differences which are added to obtain new first differences. For instance, $31421\ 365585 + 54293\ 836215 = 85715\ 201800$. Like above, some of the last figures are off by 1, but I did not correct them.

Log-sines					
4280	9.7943	40082	832103	31421	365585
		85715	201800	54293	836215
4279	9.7942	54367	630303	31466	505349
		85742	840356	54276	335007
4278	9.7941	68624	789947	31511	651651
		85770	489825	54258	838174
4277	9.7940	82854	300122	31556	804511
		85798	150223	54241	345712
4276	9.7939	97056	149899		

an so on until we reach the logsine of 4270, which should agree with that found by the direct method. Yet this agreement does not give complete assurance of the accuracy of the intermediate work, because an error in one direction may happen to be balanced by another error in the opposite direction. Therefore the logsines only were copied on the actual table, and the differences were thence set down by actual subtraction.

The arrangement for the logtangents is even simpler, for we get their differences by augmenting each difference already found from the logsines by the corresponding difference from the logcosines; and, although these be not placed the one under the other, a very ordinary computer finds no difficulty in adding them as they stand. Thus, for the same arcs, the computation of the logtangents is¹⁵

Log tangents			
4280	9.9009	16341	946368
		1	40009
4279	9.9007	76332	908353
		1	40019
4278	9.9006	36313	732990
		1	40029
4277	9.9004	96284	404991
		1	40039
4276	9.9003	56244	909056

and the same precautions were taken, while copying these upon the actual pages, as were used in the case of the logsines.

Since the logtangents for the other half of the quadrant are the arithmetical complements of these,¹⁶ it would be mere waste of labour to write them out in a preliminary table like the present.

¹⁵The values of the log tan are also usually off by 1 in the last place.

¹⁶*i.e.*, $\log \tan(100^\circ - x) = -\log \tan x$.

The fifteen decimals are here spaced in groups of four, five and six figures as in the canon of logarithms, to suit the proposed nine place table to one million.¹⁷ In order to match this, the trigonometrical table should be extended by interpolation at least to each tenth second of arc.

In proceeding so to interpolate, we observe that if Δ_1 , Δ_2 , Δ_3 represent the first, second and third differences as we have found them, δ_1 , δ_2 , δ_3 , those for intervals ten times smaller, we have¹⁸

$$\delta_1 = \frac{1}{10}\Delta_1 - \frac{9}{200}\Delta_2 + \frac{57}{2000}\Delta_3 \quad | \quad \delta_2 = \frac{1}{100}\Delta_2 - \frac{18}{2000}\Delta_3 \quad | \quad \delta_3 = \frac{1}{1000}\Delta_3.$$

The successive values, found by the application of these differences being at 10 L

$$\begin{aligned} \text{at } 9 & L - \frac{1}{10}\Delta_1 + \frac{9}{200}\Delta_2 - \frac{57}{2000}\Delta_3, \\ \text{at } 8 & L - \frac{2}{10}\Delta_1 + \frac{16}{200}\Delta_2 - \frac{96}{2000}\Delta_3, \\ \text{at } 7 & L - \frac{3}{10}\Delta_1 + \frac{21}{200}\Delta_2 - \frac{119}{2000}\Delta_3, \\ \text{at } 6 & L - \frac{4}{10}\Delta_1 + \frac{24}{200}\Delta_2 - \frac{128}{2000}\Delta_3, \\ \text{at } 5 & L - \frac{5}{10}\Delta_1 + \frac{25}{200}\Delta_2 - \frac{125}{2000}\Delta_3, \\ \text{at } 4 & L - \frac{6}{10}\Delta_1 + \frac{24}{200}\Delta_2 - \frac{112}{2000}\Delta_3, \\ \text{at } 3 & L - \frac{7}{10}\Delta_1 + \frac{21}{200}\Delta_2 - \frac{91}{2000}\Delta_3, \\ \text{at } 2 & L - \frac{8}{10}\Delta_1 + \frac{16}{200}\Delta_2 - \frac{64}{2000}\Delta_3, \\ \text{at } 1 & L - \frac{9}{10}\Delta_1 + \frac{9}{200}\Delta_2 - \frac{33}{2000}\Delta_3, \text{ and} \\ \text{at } 0 & L - \Delta_1 \end{aligned}$$

from which we see that the greatest correction from second differences is $\frac{1}{8}\Delta_2$, while the maximum correction for third differences is less than the sixteenth part of Δ_3 .

The introduction to this volume abruptly ends here.

4 Content of Sang's tables

Volume K43 was completed in 1888 and contains logarithmic sines and tangents. Sang's table is a handwritten table, but it is preceded by a printed cover page (figure 1), perhaps meant to be published.

¹⁷See my (re)construction of the nine-place table where this spacing is used [43], as well as in the reconstruction of the 15-place table [56].

¹⁸The subtabulated values of the function are obtained using Newton's forward difference formula:

$$z_x = A + x\Delta_1 + x \cdot \frac{x-1}{2}\Delta_2 + x \cdot \frac{x-1}{2} \cdot \frac{x-3}{3}\Delta_3 + \dots$$

In this case, one should consider that the differences are $-\Delta_1$, $-\Delta_2$ and $-\Delta_3$ and that x takes up the values 1/10 to 9/10. We then obtain the expressions given by Sang, which for some reason go backwards. The value of δ_1 is the difference between $z_{0.1}$ and z_0 and should actually be of opposite sign for consistency. The values of δ_2 and δ_3 are easy to compute, but Sang had incorrectly written $\delta_2 = \frac{1}{100}\Delta_2 - \frac{19}{2000}\Delta_3$. See my reconstruction of Briggs's 1624 table for details [45].

In the summary of his tables drawn in July 1890 [81, 5], Sang writes that “[U]pwards of two million eight hundred thousand figures were written for the completion of this volume.”

There are actually three separate tables, each spanning 125 pages. The first part gives the values of $10 + \log \sin x$ for centesimal angles from 100° to 50° and their differences.

The second part gives the values of $10 + \log \sin x$ for centesimal angles from 50° to 0.01° and their differences.

The third part gives the values of $10 + \log \tan x$ for centesimal angles from 50° to 0.01° and their differences.

Each part contains 41 values per page, with the last value of a page being identical to the first on the next page. Sang’s values of the logarithms of sines are correct to one or two units of the 15th place at the beginning of the table (starting at 100°), but the errors grow up to 15 units around 0° . The logarithms of tangents are similarly off up to two or three units of the 15th place at the beginning of the range (at 50°), and the errors grow up to 13 units or more at the end of range.

My reconstruction tries to follow faithfully the original tables, but there are some uncertainties, for instance regarding when the sizes of the prefixes of the logarithms of sines change. The prefixes start with 0.9999, but are later cut to three and two digits, perhaps not exactly when Sang did it. Sang may possibly not even have used a three-place prefix.

LOGARITHMIC
SINES AND TANGENTS

TO FIFTEEN PLACES,

FOR EACH TEN-THOUSANDTH PART OF THE QUADRANT.

BY

EDWARD SANG.

EDINBURGH.

1885-1888.

¹⁹**Note on the titles of the works:** Original titles come with many idiosyncrasies and features (line splitting, size, fonts, etc.) which can often not be reproduced in a list of references. It has therefore seemed pointless to capitalize works according to conventions which not only have no relation with the original work, but also do not restore the title entirely. In the following list of references, most title words (except in German) will therefore be left uncapitalized. The names of the authors have also been homogenized and initials expanded, as much as possible.

The reader should keep in mind that this list is not meant as a facsimile of the original works. The original style information could no doubt have been added as a note, but I have not done it here.

- [10] Johann Karl Burckhardt. *Table des diviseurs pour tous les nombres du troisième million, ou plus exactement, depuis 2028000 à 3036000, avec les nombres premiers qui s’y trouvent*. Paris: Veuve Courcier, 1816. [also published in [11] together with [12] and [9]]
- [11] Johann Karl Burckhardt. *Table des diviseurs pour tous les nombres des 1^{er}, 2^e et 3^e million, ou plus exactement, depuis 1 à 3036000, avec les nombres premiers qui s’y trouvent*. Paris: Veuve Courcier, 1817. [each part was also published separately as [12], [9], and [10]]
