(I will be glad to receive any comment which helps me to improve this Erratum/Addendum. Updates are published at hal.inria.fr).

- page 56, Lemma 2.64: $H(s)$ is proper, so it is expandable in nonnegative powers of $\frac{1}{s}$ near $s=\infty$.
- page 94 Lemma 3.16, 1: $\mu_{\min }(L)$ is $\lambda_{\min }\left(\frac{1}{2}\left(L+L^{\top}\right)\right)$.
- section 3.1.7: there exists a canonical form for descriptor variable systems which are passive, as shown in references $[47,50]$ page 246. Let $(E, A, B, C, D)$ in (3.55) have a transfer function which is positive real, and the state space realisation in (3.55) be minimal (see [50] for mimimality conditions for descriptor variable systems). Then the canonical form is a special Weierstrass form which writes as:

$$
\left\{\begin{array}{l}
\dot{x}_{1}=A_{1} x_{1}+B_{1} u  \tag{1}\\
\dot{x}_{2}=x_{3}+B_{2} u \\
0 \times \dot{x}_{3}=0=x_{2}+B_{3} u \\
y=C_{1} x_{1}+C_{2} x_{2}+C_{3} x+3+D u
\end{array}\right.
$$

where $x_{3}$ is the algebraic variable. It can be shown that the quadruple $\left(A_{1}, B_{1}, C_{1}, \hat{D}\right)$ is passive, with $\hat{D}=D-C_{3} B_{2}-C_{2} B_{3}$, and there exists a matrix $P_{3}=P_{3}^{\top} \succcurlyeq 0$ such that $B_{3}^{\top} P_{3}=-C_{3}$. The system verifies a LMI as in (3.150) (with relevant matrices) for some $P_{1}=P_{1}^{\top} \succcurlyeq 0$. If the system is strongly SPR and minimal then $P_{1} \succ 0$. Storage functions of the descriptor variable system are of the form $\frac{1}{2} x_{1}^{\top} P_{1} x_{1}+\frac{1}{2} x_{3}^{\top} P_{3} x_{3}$.

- page 155 , inside the frame, end of the second line, replace $\preccurlyeq$ by $\succcurlyeq$.

[^0]- page 161, line 4 above Remark 3.88: delete "theoremFaurre"
- page 167, lemma 3.94: the Lemma as stated in the third and the second editions, is wrong and the first inequality in (3.217) is obviously incorrect in general.

Lemma 1 (corrected Lemma 3.94) Let $D \succ 0$, and let $\Phi: \mathbb{R}^{m} \rightrightarrows \mathbb{R}^{m}$ be a maximal monotone mapping. Then the generalised equation $y \in C x-D \Phi(y)$ has a unique solution.

Proof: $y \in C x-D \Phi(y) \Leftrightarrow D^{-1} y+\Phi(y) \ni D^{-1} C x \Leftrightarrow\left(D^{-1}+\Phi\right)(y) \ni D^{-1} C x \Leftrightarrow y \in$ $\left(D^{-1}+\Phi\right)^{-1}\left(D^{-1} C x\right)$. There are several ways to prove the result. Consider the mapping $A: y \mapsto A(y)=\left(D^{-1}+\Phi\right)(y)$. Let $x_{1}, x_{2} \in \operatorname{dom}(A), y_{1} \in A\left(x_{1}\right), y_{2} \in A\left(x_{2}\right)$. Then $\left\langle x_{1}-x_{2}, y_{1}-y_{2}\right\rangle=\left\langle x_{1}-x_{2}, D^{-1}\left(x_{1}-x_{2}\right)\right\rangle+\left\langle x_{1}-x_{2}, \xi_{1}-\xi_{2}\right\rangle$ where $\xi_{1} \in \Phi\left(x_{1}\right), \xi_{2} \in \Phi\left(x_{2}\right)$. Thus $\left\langle x_{1}-x_{2}, y_{1}-y_{2}\right\rangle \geq\left\langle x_{1}-x_{2}, D^{-1}\left(x_{1}-x_{2}\right)\right\rangle$ (using the monotonicity of $\Phi(\cdot)$ ), and thus $\left\langle x_{1}-x_{2}, y_{1}-\right.$ $\left.y_{2}\right\rangle \geq \frac{1}{2} \lambda_{\min }\left(D^{-1}+D^{-\top}\right)\left\langle x_{1}-x_{2}, x_{1}-x_{2}\right\rangle$ (since $D^{-1} \succ 0$ and thus $D^{-1}+D^{-\top} \succ 0$ ). Therefore the mapping $A(\cdot)$ is strongly monotone, and so is the mapping $y \mapsto-D^{-1} C x+A(y)$. Using [3, Proposition 23.36, Corollary 23.37], it follows that the generalised equation $0 \in-D^{-1} C x+A(y)$ has a unique solution.

The result also follows from the application of [1, Theorem 3.3], that is itself a consequence of [4, Corollary 32.25]. It states that the generalised equation $z \in F(y)+G(y)$ with $F(\cdot)$ single-valued Lipschitz continuous and strongly monotone and $G(\cdot)$ set-valued maximal monotone, always has a unique solution. Here the generalized equation is $D^{-1} y+\Phi(y) \ni D^{-1} C x$, hence the result follows. When $\Phi=\partial \phi$ for some proper convex lower semicontinuous function $\phi(\cdot)$, then the result follows from Proposition 1 in reference [278] page 255, which states that the operator $\left(D^{-1}+\Phi\right)^{-1}(\cdot)$ is Lipschitz continuous, single-valued and well-defined.

Notice that $D$ needs not be symmetric for the Lemma to hold. Assume in addition that $D=D^{\top}$, and let $D=R^{2}, R=R^{\top} \succ 0$. The generalised equation is equivalent to $R^{-1} y \in R^{-1} C x-$ $R \Phi\left(R R^{-1} y\right)$. Define $z=R^{-1} y$, then $z \in R^{-1} C x-R \Phi(R z)$. The mapping $\bar{\Phi}: z \mapsto R \Phi(R z)=$ $R^{\top} \Phi(R z)$ is maximal monotone. The generalised equation $z \in R^{-1} C x-R \Phi(R z) \Leftrightarrow z+\bar{\Phi}(z) \ni$ $R^{-1} C x \Leftrightarrow z \in\left(I_{m}+\bar{\Phi}\right)^{-1}\left(R^{-1} C x\right)$. If $\bar{\Phi}=\partial \bar{\phi}$ for some proper, convex lower semicontinuous function $\bar{\phi}(\cdot)$, then Lemma A. 98 (page 692) can be applied to conclude about uniqueness of the solution.

Another result can be stated:
Lemma 2 (corrected Lemma 3.94) Let $D$ be a $P$-matrix, and let $\Phi: \mathbb{R}^{m} \rightrightarrows \mathbb{R}^{m}$ be defined as $\Phi(y)=\partial \psi_{K}(y)$, where $K=\mathbb{R}_{+}^{m}$, and $\psi_{K}(\cdot)$ is its indicator function. Then the generalised equation $y \in C x-D \Phi(y)$ has a unique solution.

Proof: Similarly as in the previous proof, the generalised equation is rewritten equivalently $D^{-1} y+\Phi(y) \ni D^{-1} C x$, where $P^{-1}$ is also a P-matrix. Equivalently $y \in\left(D^{-1}+\Phi\right)^{-1}\left(D^{-1} C x\right)$. Using Proposition 2 in reference [278] page 255, it follows that the mapping $\left(D^{-1}+\Phi\right)^{-1}(\cdot)$ is

Lipschitz continuous, single-valued and well-defined, $y$ being the solution of a linear complementarity problem with P-matrix. $\boxtimes$

Of course the above results hold true in case $\Phi(\cdot)$ is single-valued and monotone (maximality then holds). Assume now that $\Phi(\cdot)$ is hypomonotone with constant $k$ (this holds if $\Phi(\cdot)$ is differentiable, with bounded derivative, and sector bounded). Then the generalised equation is rewritten as $y \in C x-D(\Phi(y)+k y)+k D y$ where the mapping $y \mapsto \Phi(y)+k y$ is maximal monotone. Consequently the generalised equation is equivalent to $D^{-1} y \in D^{-1} C x-(\Phi(y)+$ $k y)+k y \Leftrightarrow\left(D^{-1}-k I_{m}\right) y \in D^{-1} C x-(\Phi(y)+k y)$. The condition here is that $D^{-1}-k I_{m} \succ$ $0 \Leftrightarrow D^{-1} \succ k I_{m} \Leftrightarrow D \prec k I_{m}$. It is noteworthy that these results are close in spirit to the results stated in [2] where $\Phi(\cdot)$ is a saturation function (hence monotone mapping), though the equation considered in [2] is different as it takes the form $y=D x-\left(D-I_{m}\right) \Phi(y)$.
The case with $D \succcurlyeq 0$ is more tricky but more general since it encompasses $D=0$ that yields $y=C x$. Extensions can be stated in particular cases like $D=\operatorname{blockdiag}\left(D_{1}, 0\right)$ with $D_{1} \succ 0$ an $m_{1} \times m_{1}$ matrix, $m_{1} \leq m$, and if $\Phi(y)=\left(\Phi_{1}\left(y_{1}\right), \Phi_{2}\left(y_{2}\right), \ldots, \Phi_{m}\left(y_{m}\right)\right)^{\top}$. For instance if $\phi(y)=\left|y_{1}\right|+\left|y_{2}\right|+\ldots+\left|y_{m}\right|$, then $\partial \phi(y)=\left(\operatorname{sgn}\left(y_{1}\right), \ldots, \operatorname{sgn}\left(y_{m}\right)\right)^{\top}$. The generalised equation takes the form $\binom{y_{1}}{y_{2}} \in C x-\binom{D_{1}\left(\operatorname{sgn}\left(y_{1}\right), \ldots, \operatorname{sgn}\left(y_{m_{1}}\right)\right)^{\top}}{0}$. Thus the generalised equation is equivalent to $y_{2}=C_{2} x$ and $y_{1} \in C_{1} x-D_{1} \Phi_{1}\left(y_{1}\right)$ : both Lemmae can be applied to this reduced generalised equation:

Corollary 1 (corrected Lemma 3.94) Assume that $D=\left(\begin{array}{cc}D_{1} & 0 \\ 0 & 0\end{array}\right)$ with $D_{1}$ an $m_{1} \times m_{1}$ matrix, $m_{1} \leq m$. Let $y=\binom{y_{1}}{y_{2}} y_{1} \in \mathbb{R}^{m_{1}}, y_{2} \in \mathbb{R}^{m-m_{1}}$, and $C=\binom{C_{1}}{C_{2}}, C_{1} \in \mathbb{R}^{m_{1} \times n}, C_{2} \in$ $\mathbb{R}^{\left(m-m_{1}\right) \times n}$. Assume further that $\Phi=\binom{\Phi_{1}\left(y_{1}\right)}{\Phi_{2}(y)}, \Phi_{1}: \mathbb{R}^{m_{1}} \rightrightarrows R^{m_{1}}$. Then the generalised equation $y \in C x-D \Phi(y)$ is equivalent to $y_{2}=C_{2} x$ and the reduced generalised equation $y_{1} \in$ $C_{1} x-D_{1} \Phi_{1}\left(y_{1}\right)$, and both Lemmae 1 and 2 apply to the reduced generalised equation.

- page 602, line after (8.117): Corollary 4 is Corollary 2 in reference [5] page 603.
- page 691, Lemma A.96: it is $\left\|x_{1}-x_{2}\right\|^{2}$ (this typo is also present in the article [70]).
- page 692, Lemma A.98: The function $\phi(\cdot)$ is proper, convex and lower semicontinuous.
