HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Uptake of fatty acids by enterocytes is debated in the literature and usually reviewed as a dual mechanism

Are the observed dose-response curves of apical enterocyte FA uptake compatible with the pathways suggested by the literature?

Mathematical modeling and data fitting

pH increases the uptake response

For intermediate parameter values
Dose-responses : collection time set to 10min

Result 2

Further study of dose-responses at different collection times

For parameter maximizing the uptake

M2 and M2.pH enable greater uptake responses and slope discontinuities

Experimental data

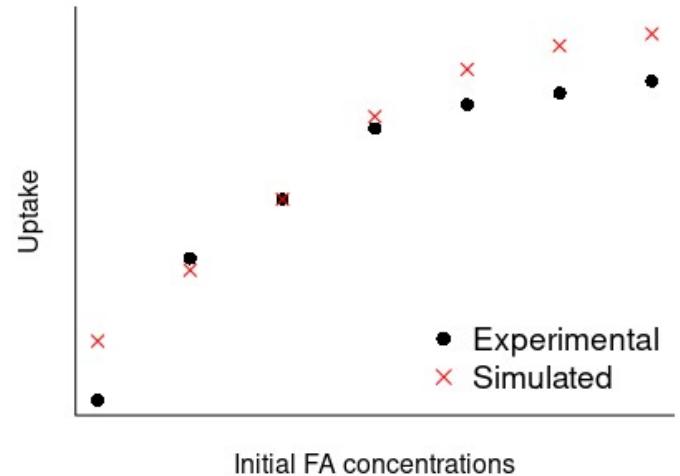

- 7 datasets
- Digitized from research papers using WebPlotDigitizer¹
- Expressed in the same units of measure ($\mu\text{mol}/\text{mg protein}/\text{min}$) using conversion factors found in the literature

¹ Rohatgi, A. (2020). WebPlotDigitizer (Pacific, California, USA)
<https://automeris.io/WebPlotDigitizer/>

$$\frac{k_{cat}}{K_M} \quad \frac{V_{ext}}{V_{in}}$$

Data fitting

- MCMC algorithm (FME package, R) (Bayesian methods)
- Parameter *a posteriori* distributions
 - We have >1,000 values for each parameter for each model and each dataset

Quality of fits

M2 and M2.pH show better quality of fits
(*The lower the normalized RMSE, the better the fit*)

Chow, S.L., and Hollander, D. (1979a) J. Lipid Res. 20, 349–356.

Goré, J., and Hoinard, C. (1993) J. Nutr. 123, 66–73.

Murota, K., and Storch, J. (2005) J. Nutr. 135, 1626–1630.

Stremmel, W. (1988) J. Clin. Invest. 82, 2001–2010.

- Responses of M0 and M1 are far from data (even with pH)
- Responses of M2 and M2.pH are close to data

Only M2 and M2.pH show slope discontinuities

Conclusion

Take-home messages

- pH enhances uptake
- Passive diffusion alone (M0) is not sufficient to provide realistic uptake responses
- Adding an intracellular enzymatic transformation of FA (M2) is more efficient for the enterocyte than adding a membrane protein (M1)

Perspectives

- New experimental uptake data to improve our understanding
- Gaining insights on sensitive topics using quantitative and mechanistic modeling

Open to discussion!
