L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

# USING THE CHARLAP-COLEY-ROBBINS POLYNOMIALS FOR COMPUTING ISOGENIES

FRANÇOIS MORAIN

ABSTRACT. The SEA algorithm for computing the cardinality of elliptic curves over finite fields in many characteristic uses modular polynomials. These polynomials come into different flavors, and methods to compute them flourished. Once equipped with some modular polynomials for prime  $\ell$ , algebraic formulas are used to compute a curve  $\mathcal{E}^*/\mathbb{F}_q$  that is  $\ell$ -isogenous to the curve of interest  $\mathcal{E}$ . These formulas involve derivatives of the modular polynomial that may sometime vanish. One way to overcome this problem is to use alternative trivariate polynomials  $U_\ell$ ,  $V_\ell$ , and  $W_\ell$  introduced by Charlap, Coley and Robbins to overcome some difficulties in the first versions of Elkies's approach. We give properties of these polynomials, as well as formulas to compute the isogenous curve that were sketched by Atkin. Also we investigate another suggestion of Atkin using modular polynomials associated to a power product of Dedekind's  $\eta$  function.

## 1. INTRODUCTION

Computing isogenies is the central ingredient of the Schoof-Elkies-Atkin (SEA) algorithm that computes the cardinality of elliptic curves over finite fields of large characteristic [20, 2, 10] and also [4]. More recently, it is used in post-quantum cryptography [8, 13, 6, 12] among others, as well as the cryptosystems [9, 19, 11].

Given a curve  $\mathcal{E}/\mathbb{F}_q$ , we need to compute  $\ell$ -isogenous curves for (small) prime  $\ell$ 's, starting from a root of some degree  $\ell + 1$  modular polynomial  $\Psi_\ell(X, Y)$  in  $X = j(\mathcal{E})$ . The coefficients of the isogenous curve  $\mathcal{E}^*/\mathbb{F}_q$  together with the kernel polynomial of the isogeny are computed from partial derivatives of  $\Psi_\ell(X, Y)$ . This method works except in cases where one of the derivatives is zero. This is a theoretical as well as practical problem. An alternative to this is to use the original approach of Elkies [10], namely using algebraic relations for  $A^*$  and  $B^*$ . Another choice is to use the CCR polynomials  $(U_\ell, V_\ell, W_\ell)$  introduced in [7], for the price of finding the roots of three degree  $\ell + 1$  polynomials instead of 1. Several methods for computing these polynomials, as well as rational representations of  $A^*$  and  $B^*$  are given in [15] (as well as the cited references in this article).

---

*Date:* March 1, 2023.

The author is on leave from Délégation Générale pour l'Armement.

The aim of our work (which is closely related to [15]) is to give formulas to compute the necessary parameters for Elkies's algorithms, using partial derivatives of  $U_\ell$ , in the spirit of Atkin and following the suggestion in [2]. The same work is done for the alternate polynomial  $U^a$  suggested by Atkin when  $\ell \equiv 11 \pmod{12}$ .

The content is as follows. We review the SEA algorithm in Section 2, including formulas for Eisenstein series and introduce the CCR polynomials in Section 3. Section 4 is the central part of the article, working out the formulas giving the coefficients of the isogenous curve.

## 2. SCHOOF/ELKIES/ATKIN

### 2.1. Prerequisites.

2.1.1. *Division polynomials.* For  $\mathcal{E} : y^2 = x^3 + Ax + B$ , multiplication of a point  $(X, Y)$  by positive  $n$  on  $\mathcal{E}$  is given by

$$[n](X, Y) = \left( \frac{\phi_n(X, Y)}{\psi_n(X, Y)^2}, \frac{\omega_n(X, Y)}{\psi_n(X, Y)^3} \right)$$

where the polynomials satisfy

$$\phi_n = X\psi_n^2 - \psi_{n+1}\psi_{n-1}, \quad 4Y\omega_n = \psi_{n+2}\psi_{n-1}^2 - \psi_{n-2}\psi_{n+1}^2$$

and  $\phi_n, \psi_{2n+1}, \psi_{2n}/(2Y), \omega_{2n+1}/Y, \omega_{2n}$  belong to  $\mathbb{Z}[A, B, X]$ . It is customary to simplify this using

$$f_n(X) = \begin{cases} \psi_n(X, Y) & \text{for } n \text{ odd} \\ \psi_n(X, Y)/(2Y) & \text{for } n \text{ even} \end{cases}$$

with first values

$$f_{-1} = -1, \quad f_0 = 0, \quad f_1 = 1, \quad f_2 = 1, \\ f_3(X, Y) = 3X^4 + 6AX^2 + 12BX - A^2$$

$$f_4(X, Y) = X^6 + 5AX^4 + 20BX^3 - 5A^2X^2 - 4ABX - 8B^2 - A^3.$$

The degree of  $f_n$  is  $(n^2 - 1)/2$  for odd  $n$  and  $(n^2 - 4)/2$  for even  $n$ . If  $X$  has weight 1,  $A$  weight 2 and  $B$  weight 3, all monomials in  $f_n$  have the same weighted degree equal to the degree of  $f_n$ .

2.1.2. *Modular functions and such.* Letting  $q = \exp(2i\pi\tau)$ , one defines

$$E_2(q) = 1 - 24 \sum_{n=1}^{\infty} \delta_1(n)q^n, \\ E_4(q) = 1 + 240 \sum_{n=1}^{\infty} \delta_3(n)q^n, \\ E_6(q) = 1 - 504 \sum_{n=1}^{\infty} \delta_5(n)q^n,$$

where  $\delta_r(n)$  denotes the sum of the  $r$ -th powers of the divisors of  $n$ . The series  $E_4$  and  $E_6$  are modular forms of weight 4 and 6 respectively. The

function  $E_2$  is not a modular form, but note that  $\mathcal{F}_n(\tau) = E_2(\tau) - nE_2(n\tau)$  is a modular form of weight 2 for  $\Gamma_0(n)$  and trivial multiplier (see [18] and [3]).

When  $F(q) = \sum_{n \geq n_0} a_n q^n$ , we introduce the operator

$$(1) \quad F'(q) = \frac{1}{2i\pi} \frac{dF}{d\tau} = q \frac{dF}{dq} = \sum_{n \geq n_0} n a_n q^n.$$

Several identities are classical:

$$(2) \quad \Delta = \frac{E_4^3 - E_6^2}{1728}, \quad j = \frac{E_4^3}{\Delta}, \quad j - 1728 = \frac{E_6^2}{\Delta},$$

$$(3) \quad \frac{j'}{j} = -\frac{E_6}{E_4}, \quad \frac{j'}{j - 1728} = -\frac{E_4^2}{E_6}, \quad j' = -\frac{E_4^2 E_6}{\Delta}, \quad \frac{\Delta'}{\Delta} = E_2,$$

to which we add the Ramanujan differential system:

$$(4) \quad 3E_4' = E_4 E_2 - E_6, \quad 2E_6' = E_6 E_2 - E_4^2, \quad 12E_2' = E_2^2 - E_4.$$

**2.2. Schoof's approach.** Let  $\mathcal{E}/\mathbb{F}_q$  be an elliptic curve of cardinality  $m = p + 1 - t$  with  $|t| \leq 2\sqrt{q}$  by Hasse's theorem. Schoof gave the first deterministic polynomial time algorithm to compute  $m$ . The idea is to use the action of the Frobenius of  $\mathcal{E}$  on  $\ell$ -division points to find  $t$  via the characteristic equation  $\phi^2 - [t]\phi + [q] = 0$  modulo  $(f_\ell, \ell)$ .

**2.3. Using isogenies.** Elkies and Atkin gave subsequent improvements to make Schoof's algorithm efficient (and probabilistic) and usable in practice. Elkies described how to use isogenies to find factors of small degree of  $f_\ell(X)$  over a finite field, provided the Frobenius equation splits modulo  $\ell$ . Using modular polynomials, Elkies worked out a procedure to compute all the parameters needed to build a degree  $\ell$  isogeny from  $\mathcal{E} : Y^2 = X^3 + AX + B$  to some curve  $\mathcal{E}^* : Y^2 = X^3 + A^*X + B^*$  and the kernel polynomial of the isogeny, thereby giving the factor we need. Atkin designed his own route towards the same goal, putting the emphasis on the use of more modular equations for  $X_0(\ell)$  and its quotients.

One has (after renormalization):

$$A = -3E_4(q), \quad B = -2E_6(q).$$

With a compatible scaling, we get

$$A^* = -3\ell^4 E_4(q^\ell), \quad B^* = -2\ell^6 E_6(q^\ell).$$

More importantly, writing  $\sigma_r$  for the power sums of the roots of  $U_\ell$ , we have

$$\sigma_1 = \frac{\ell}{2} (\ell E_2(q^\ell) - E_2(q)) = -\frac{\ell}{2} \mathcal{F}_\ell(q).$$

Beyond this, Elkies proved that

$$\begin{aligned} A - A^* &= 5(6\sigma_2 + 2A\sigma_0), \\ B - B^* &= 7(10\sigma_3 + 6A\sigma_1 + 4B\sigma_0), \end{aligned}$$

together with an induction relation satisfied by other  $\sigma_k$  for  $k > 3$ . As a consequence  $A^*$  and  $B^*$  belong to  $\mathbb{Q}[\sigma_1, A, B]$  since  $\sigma_2$  and  $\sigma_3$  do.

Given these quantities, there are several algorithms to get the isogeny. We refer to [5] for this.

### 3. THE POLYNOMIALS OF CHARLAP-COLEY-ROBBINS

**3.1. Theory.** We start from an elliptic curve  $\mathcal{E} : Y^2 = X^3 + AX + B$  and we fix some odd prime  $\ell$ , putting  $d = (\ell - 1)/2$ . Our aim is to find the equation of an  $\ell$ -isogenous curve  $\mathcal{E}^* : Y^2 = X^3 + A^*X + B^*$ .

**Theorem 3.1.** *There exist three polynomials  $U_\ell, V_\ell, W_\ell$  in  $\mathbb{Z}[X, Y, Z, 1/\ell]$  of degree  $\ell+1$  in  $X$  such that  $U_\ell(\sigma_1, A, B) = 0$ , respectively  $V_\ell(A^*, A, B) = 0$ ,  $W_\ell(B^*, A, B) = 0$ .*

Let us turn our attention to the properties of these polynomials.

**Theorem 3.2.** *When  $\ell > 3$ , the polynomials  $U_\ell, V_\ell, W_\ell$  live in  $\mathbb{Z}[X, Y, Z]$ .*

**Proposition 3.3.** *Assigning respective weights 1, 2, 3 to  $X, Y, Z$ , the monomials in  $U_\ell, V_\ell$  and  $W_\ell$  have generalized degree  $\ell + 1$ .*

**3.2. Computing isogenous curves over finite fields.** When using  $U_\ell, V_\ell, W_\ell$ , we need to find the roots of three polynomials of degree  $\ell + 1$  instead of 1. In general, if  $U_\ell$  has rational roots (it should be 1, 2 or  $\ell + 1$ ), then this is the case for each of  $V_\ell, W_\ell$ . For each triplet of solutions  $(\sigma_1, z_1, z_2)$  we need to test whether this leads to an isogeny or not. To speed up things, we may compute rational fractions for  $A^*$  and  $B^*$  as explained in [16] (see also [17, §7]). Another path was sketched by Atkin in [2], and this is what we describe next.

### 4. REVISITING CCR *à la* ATKIN

The idea is to generalize the approach in [1, 2, 14], that is exploit  $q$ -series identities to get the parameters  $(\sigma, A^*, B^*)$ , where we write  $\sigma$  for  $\sigma_1$  from now on.

**4.1. Properties of  $U_\ell$ .** We write for readability  $U = U_\ell$  and

$$\partial_\sigma = \frac{\partial U}{\partial \sigma}, \partial_4 = \frac{\partial U}{\partial E_4}, \partial_6 = \frac{\partial U}{\partial E_6}.$$

and propagate the notation to double derivatives.

The polynomial  $U$  is homogeneous with weights, so that

$$(2) \quad (\ell + 1)U = \sigma \partial_\sigma + 2E_4 \partial_4 + 3E_6 \partial_6.$$

Note that partial derivatives of  $U$  are also homogeneous polynomials and we find

$$(3) \quad \ell \partial_\sigma = \sigma \partial_{\sigma\sigma} + 2E_4 \partial_{\sigma 4} + 3E_6 \partial_{\sigma 6},$$

$$(7) \quad (\ell - 1) \partial_4 = \sigma \partial_{\sigma 4} + 2E_4 \partial_{44} + 3E_6 \partial_{46},$$

$$(8) \quad (\ell - 2) \partial_6 = \sigma \partial_{\sigma 6} + 2E_4 \partial_{46} + 3E_6 \partial_{66}.$$

## 4.2. Getting the isogenous curve from CCR polynomials.

### 4.2.1. Finding $\tilde{E}_4$ .

**Proposition 4.1.** *The value of  $\tilde{E}_4$  is given by*

$$-\frac{4\ell(3E_4^2\partial_6 + 2E_6\partial_4) - \partial_\sigma(\ell^2E_4 + 4\sigma^2)}{\ell^4\partial_\sigma}.$$

*Proof:* We differentiate (using (1))  $U(\sigma, E_4, E_6) = 0$  to get

$$(9) \quad \sigma'\partial_\sigma + E_4'\partial_4 + E_6'\partial_6 = 0.$$

We differentiate  $\sigma = \ell/2(\ell\tilde{E}_2 - E_2)$  leading to

$$\sigma' = \frac{\ell}{2}(\ell^2\tilde{E}_2' - E_2') = \frac{\ell}{24}(\ell^2(\tilde{E}_2^2 - \tilde{E}_4) - (E_2^2 - E_4)).$$

Replace  $\ell\tilde{E}_2$  by  $2\sigma/\ell + E_2$  to get

$$\sigma' = \frac{\ell}{24} \left( \frac{4\sigma^2}{\ell^2} + \frac{4\sigma}{\ell}E_2 - (\ell^2\tilde{E}_4 - E_4) \right),$$

that we plug in (9) together with the expressions for  $E_4'$  and  $E_6'$  from equation (4) to get a polynomial of degree 1 in  $E_2$  whose coefficient of  $E_2$  is

$$\sigma\partial_\sigma + 2E_4\partial_4 + 3E_6\partial_6,$$

which we recognize in (5). Therefore, we get

$$(10) \quad (\ell + 1)UE_2 + \frac{\ell}{4}\frac{\partial_\sigma}{\partial_\sigma} \left( \frac{4\sigma^2}{\ell^2} - (\ell^2\tilde{E}_4 - E_4) \right) - 2E_6\partial_4 - 3E_4^2\partial_6 = 0$$

from which we deduce  $\tilde{E}_4$  since  $U(\sigma, E_4, E_6) = 0$ .  $\square$

### 4.2.2. Finding $\tilde{E}_6$ .

**Proposition 4.2.** *The value of  $\tilde{E}_6$  may be written*

$$\tilde{E}_6 = -\frac{N}{\ell^6\partial_\sigma^3}$$

where  $N$  is some polynomial of degree 3 in  $\ell$  and given at the end of the proof.

*Proof:* We differentiate (9).

$$(11) \quad \sigma''\partial_\sigma + \sigma'(\sigma'\partial_{\sigma\sigma} + E_4'\partial_{\sigma 4} + E_6'\partial_{\sigma 6})$$

$$(12) \quad + E_4''\partial_4 + E_4'(\sigma'\partial_{4\sigma} + E_4'\partial_{44} + E_6'\partial_{46})$$

$$(13) \quad + E_6''\partial_6 + E_6'(\sigma'\partial_{6\sigma} + E_4'\partial_{64} + E_6'\partial_{66}) = 0$$

We compute in sequence

$$12E_2'' = 2E_2E_2' - E_4' = E_2(E_2^2 - E_4)/6 - (E_2E_4 - E_6)/3,$$

$$12\tilde{E}_2'' = 2\tilde{E}_2\tilde{E}_2' - \tilde{E}_4' = \tilde{E}_2(\tilde{E}_2^2 - \tilde{E}_4)/6 - (\tilde{E}_2\tilde{E}_4 - \tilde{E}_6)/3,$$

which give us the value

$$\sigma'' = \frac{\ell}{2} (\ell^3 \tilde{E}_2'' - E_2'')$$

to be used in (11). Differentiating relations of (4), we get

$$E_4'' = \frac{1}{3} (E_2' E_4 + E_2 E_4' - E_6'), \quad E_6'' = \frac{1}{2} (E_2' E_6 + E_2 E_6' - 2E_4 E_4'),$$

to be used in lines (12) and (13) respectively. We replace  $\tilde{E}_4$  by its value from (10), and  $\tilde{E}_2$  using  $\sigma = (\ell/2)(\ell\tilde{E}_2 - E_2)$ . This finally yields an expression as polynomial in  $E_2$ :

$$C_2 E_2^2 + C_1 E_2 + C_0 = 0.$$

The unknown  $\tilde{E}_6$  is to be found in  $C_0$  only.

By luck(?)

**Proposition 4.3.** *The coefficients  $C_1$  and  $C_2$  vanish for a triplet such that  $U_\ell(\sigma, E_4, E_6) = 0$ .*

*Sketch of the proof:* The strategy to prove this is the same in both cases. Replace  $\partial_{\sigma\sigma}$ ,  $\partial_{44}$  and  $\partial_{66}$  by their values from (6). Factoring the resulting expressions yields the same factor  $\sigma\partial_\sigma + 2E_4\partial_4 + 3E_6\partial_6$ , which cancels  $C_1$  and  $C_2$ . We add a SageMath script for the convenience of the reader as an appendix to this work.  $\square$

We are left with

$$\tilde{E}_6 = -\frac{N}{\ell^6 \partial_\sigma^3}$$

where  $N$  is a polynomial in degree 3 in  $\ell$

$$N = -E_6 \partial_\sigma^3 \ell^3 + c_2 \ell^2 + 12 \partial_\sigma^2 \sigma (3E_4^2 \partial_6 + 2E_6 \partial_4) \ell - \partial_\sigma^3 \sigma^3.$$

The coefficient  $c_2$  is heavy looking and we give slightly factored as a polynomial in  $E_4$ :

$$\begin{aligned} c_2 = & 18(\partial_6^2 \partial_{\sigma\sigma} - 2\partial_6 \partial_\sigma \partial_{\sigma 6} + \partial_{66} \partial_\sigma^2) E_4^4 \\ & + (24E_6 \partial_4 (\partial_6 \partial_{\sigma\sigma} - \partial_\sigma \partial_{\sigma 6}) + 24E_6 \partial_\sigma (\partial_{46} \partial_\sigma - \partial_6 \partial_{\sigma 4}) + 10\partial_4 \partial_\sigma^2) E_4^2 \\ & + 3\partial_\sigma^2 (7E_6 \partial_6 - \sigma \partial_\sigma) E_4 + 8E_6^2 (\partial_4^2 \partial_{\sigma\sigma} - 2\partial_4 \partial_\sigma \partial_{\sigma 4} + \partial_{44} \partial_\sigma^2). \square \end{aligned}$$

4.2.3. *Numerical example.* Consider  $E : Y^2 = X^3 + X + 3$  over  $\mathbb{F}_{1009}$  and  $\ell = 5$ . Using

$$U_5(X) = X^6 + 20X^4 A + 160X^3 B - 80X^2 A^2 - 128XAB - 80B^2,$$

we select  $\sigma = 584$  and compute

$$\partial_\sigma = 905, \partial_4 = 779, \partial_6 = 140$$

from which  $\tilde{E}_4 = 497$ ,  $A^* = 441$ . After tedious computations, we find  $B^* = 997$ .

**4.3. The case  $\ell \equiv 11 \pmod{12}$ .** In this case, Atkin suggests to replace  $\sigma$  with  $f(q) = (\eta(q)\eta(q^\ell))^2$ , where  $\eta$  is Dedekind's function. The corresponding modular polynomial  $U_\ell^a$  can be computed using the techniques described in [15]. For instance (using the basis with  $E_4$ ,  $E_6$  and  $\Delta$ ):

$$U_{11}^a(X) = X^{12} - 990 \Delta X^6 + 440 E_4 \Delta X^4 - 165 E_6 \Delta X^3 + 22 E_4^2 \Delta X^2 - E_6 E_4 \Delta X - 11 \Delta^2,$$

which is sparser than  $U_{11}(X)$ .

**4.3.1. Some properties of  $U_\ell^a$ .** Let  $v_2$  (resp.  $v_3$ ) be the maximal power of  $1/2$  (resp.  $1/3$ ) of the coefficients of  $U_\ell^a(X)$  that we found experimentally

$\ell$	$v_2$	$v_3$
11	16	12
23	32	24
47	64	48
59	80	60
71	96	72

It seems that  $f/12$  should be a more sensible choice, leading to  $12^{\ell+1}U_\ell^a(X/12)$  having integer coefficients.

We have formulas analogous to (6), due the corresponding homogeneous property

$$(14) \quad \ell \partial_f = f \partial_{ff} + 2E_4 \partial_{f4} + 3E_6 \partial_{f6},$$

$$(15) \quad (\ell - 1) \partial_4 = f \partial_{f4} + 2E_4 \partial_{44} + 3E_6 \partial_{46},$$

$$(16) \quad (\ell - 2) \partial_6 = f \partial_{f6} + 2E_4 \partial_{46} + 3E_6 \partial_{66}.$$

**4.3.2. Computing  $\sigma$ ,  $\tilde{E}_4$  and  $\tilde{E}_6$ .**

**Proposition 4.4.** *The value of  $\sigma$  is*

$$\sigma = \frac{\ell (3 \partial_6 E_4^2 + 2 \partial_4 E_6)}{f \partial_f}.$$

*Proof:* Remark that  $f^{12} = \Delta(z)\Delta(\ell z)$  and therefore we deduce the discriminant  $\tilde{\Delta} = f^{12}/\Delta$  of the isogenous curve. We have also (using (3)):

$$12 \frac{f'}{f} = \frac{\Delta'}{\Delta} + \ell \frac{\tilde{\Delta}'}{\tilde{\Delta}} = E_2 + \ell \tilde{E}_2,$$

from which we deduce  $f'$ . Again,  $U_\ell^a$  is homogeneous with weight  $\ell + 1$ , so that we have identities similar to those for  $\sigma$ . In particular

$$(17) \quad (\ell + 1)U_\ell^a = f \partial_f + 2E_4 \partial_4 + 3E_6 \partial_6.$$

Starting from  $f' \partial_f + E_4' \partial_4 + E_6' \partial_6 = 0$ , and replacing by the known values, we find

$$(f \partial_f + 4E_4 \partial_4 + 6E_6 \partial_6) E_2 + f \ell \tilde{E}_2 \partial_f - 6E_4^2 \partial_6 - 4E_6 \partial_4 = 0,$$

which is

$$f\partial_f(\ell\tilde{E}_2 - E_2) - 6E_4^2\partial_6 - 4E_6\partial_4 = 0,$$

and this gives us the result.  $\square$

**Proposition 4.5.** *The value of  $\tilde{E}_4$  is given by*

$$\tilde{E}_4 = -\frac{M}{\ell^2 f^2 E_4 E_6 \partial_f^3}$$

where  $M$  is a polynomial given at the end of the proof.

*Proof:* We differentiate  $f'$  to obtain:

$$\begin{aligned} f'' &= \frac{1}{12} \left( f'(\ell\tilde{E}_2 + E_2) + f(\ell^2\tilde{E}'_2 + E'_2) \right) \\ &= \frac{f}{12^2} \left( (\ell\tilde{E}_2 + E_2)^2 + \ell^2(\tilde{E}_2^2 - \tilde{E}_4) + (E_2^2 - E_4) \right). \end{aligned}$$

We inject this together and the diagonal derivatives of (14) and  $\tilde{E}_2 = (E_2 + 2\sigma/\ell)/\ell$  into

$$\begin{aligned} (18) \quad & f''\partial_f + f'(f'\partial_{ff} + E'_4\partial_{f4} + E'_6\partial_{f6}) \\ (19) \quad & + E''_4\partial_4 + E'_4(f'\partial_{4f} + E'_4\partial_{44} + E'_6\partial_{46}) \\ (20) \quad & + E''_6\partial_6 + E'_6(f'\partial_{6f} + E'_4\partial_{64} + E'_6\partial_{66}) = 0 \end{aligned}$$

to get a polynomial of degree 2 in  $E_2$  whose coefficients of degree 2 and 1 turn out to vanish. We are left with

$$\tilde{E}_4 = -\frac{M}{\ell^2 f^2 E_4 E_6 \partial_f^3}$$

where

$$\begin{aligned} M &= 24(3E_6\partial_6^2\partial_{f4} + \partial_{46}\partial_f^2)fE_4^6 \\ &+ 12(9E_6^2\partial_6^2\partial_{f6} - 3E_6\partial_6^2\partial_f\ell + 6E_6\partial_6\partial_f\partial_{f6}f - \partial_6\partial_f^2\ell f + \partial_f^2\partial_{f6}f^2 \\ &\quad - 6E_6\partial_6^2\partial_f + 2\partial_6\partial_f^2)fE_4^5 + 96E_4^4E_6^2\partial_4\partial_6\partial_{f4} \\ &+ 4E_6(36E_6^2\partial_4\partial_6\partial_{f6} - 12E_6\partial_4\partial_6\partial_f\ell + 12E_6\partial_4\partial_f\partial_{f6}f - 12E_6\partial_{46}\partial_f^2f \\ &\quad + 12E_6\partial_6\partial_f\partial_{f4}f - 24E_6\partial_4\partial_6\partial_f - 5\partial_4\partial_f^2)fE_4^3 \\ &+ E_6(32E_6^2\partial_4^2\partial_{f4} - 42E_6\partial_6\partial_f^2f + \partial_f^3f^2)E_4^2 \\ &+ 16E_6^3\partial_4(3E_6\partial_4\partial_{f6} - \partial_4\partial_f\ell + 2\partial_f\partial_{f4}f - 2\partial_4\partial_f)E_4 \\ &+ 24E_6^4\partial_{46}f\partial_f^2 - 8E_6^3\partial_4\ell f\partial_f^2 + 8E_6^3\partial_{f4}f^2\partial_f^2 + 8E_6^3\partial_4f\partial_f^2. \quad \square \end{aligned}$$

Finally, we remark that  $B^*$  satisfies

$$(21) \quad B^{*2} + 6912\tilde{\Delta} - 4A^{*3}/27 = 0, \quad U_\ell^a(-\ell f, A^*, B^*) = 0,$$

the latter relation coming from applying the Atkin-Lehner involution to the modular form for  $\sigma_1$ . The gcd of these two polynomials should reveal  $B^*$ . In the rare case where this gcd has degree 2 (which would imply two elliptic

curves being isogenous to  $E$ ), we would be forced to use higher differentials, which would look like a formidable task.

4.3.3. *Numerical example.* Consider  $E : Y^2 = X^3 + X + 3$  over  $\mathbb{F}_{1009}$ . The polynomial  $U_{11}^a$  has two roots: 65 and 333. We take  $f = 65$ . We first compute  $\sigma = 75$ . Then  $\tilde{E}_4 = 532$ . The gcd of the two polynomials in (21) has degree 1 and root  $B^* = 460$ .

## 5. CONCLUSIONS

We have completed the task suggested by Atkin for using the CCR polynomials in building isogenies. All these formulas require  $O(\ell^2)$  multiplications in the base field, due to the computation of partial derivatives of polynomials of degree  $O(\ell)$ . Note that this is the same cost as using the rational fractions giving  $A^*$  and  $B^*$ , but less storage is needed.

As a consequence, we have several algorithms and formulas to be used, depending on the practical problem to be solved.
