

Learning Point Processes and Convolutional Neural Networks for Object Detection in Satellite Images

Performing object detection in remote-sensing images combining Convolutional Neural Network features with geometric priors on configurations within an Energy Based Model.

Energy map from a CNN
(computed once per image)

Input image \mathbf{X}

$$U(\mathbf{y}, \mathbf{X}, \boldsymbol{\theta}) = \sum_{y \in \mathbf{y}} w_d V_d(y, \mathbf{X}) + w_{p1} V_{p1}(y) + w_{p2} V_{p2}(y, \mathcal{N}_y) + \dots$$

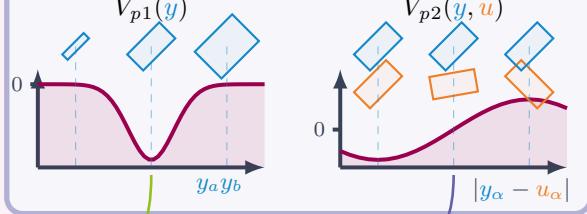

Data term
Prior term 1
on point y

Prior term 2
on point y and
neighborhood \mathcal{N}_y

Energy Based Model

measures coherence between image \mathbf{X} and configuration \mathbf{y}
 $p(\mathbf{y}|\mathbf{X}) \propto \exp(-U(\mathbf{y}, \mathbf{X}, \boldsymbol{\theta}))$

Priors on configurations
(area, size, alignment, overlap ...)

$$U(\mathbf{y}, \mathbf{X}, \boldsymbol{\theta}_n)$$

$$\mathbf{y}^{GT}$$

$$U(\mathbf{y}, \mathbf{X}, \boldsymbol{\theta}_{n+1})$$

$$\mathbf{y}^+$$

$$\mathbf{y}^-$$

Parameter Estimation

Finding $\boldsymbol{\theta}$ such that
 $\mathbf{y}^{GT} = \arg \min(\mathbf{y}) U(\mathbf{y}, \mathbf{X}, \boldsymbol{\theta})$

Contrastive Divergence:

$$\begin{aligned} \mathbf{y}^+ &\sim \mathbf{y}^{GT} + \mathcal{N}(0, \sigma) \\ \mathbf{y}^- &\sim \exp(-U(\cdot, \mathbf{X}, \boldsymbol{\theta}_n)) \\ \mathcal{L} &= U(\mathbf{y}^+, \mathbf{X}, \boldsymbol{\theta}_n) - U(\mathbf{y}^-, \mathbf{X}, \boldsymbol{\theta}_n) \\ \boldsymbol{\theta}_{n+1} &\leftarrow \boldsymbol{\theta}_n + \nabla_{\boldsymbol{\theta}_n} \mathcal{L} \end{aligned}$$

Sampling Configurations

$$\text{Markov chain } \mathbf{y}_t \sim \exp\left(-\frac{U(\cdot, \mathbf{X}, \boldsymbol{\theta})}{T_t}\right)$$

$$\mathbf{y}_t \xrightarrow[T_t \rightarrow 0]{\quad} \arg \min_{\mathbf{y}} U(\mathbf{y}, \mathbf{X}, \boldsymbol{\theta})$$

Jump

Birth: $\mathbf{y}' = \mathbf{y} \cup \{y\}$, $y \sim \exp(-\mathbf{V}_d)$

Death: $\mathbf{y}' = \mathbf{y} \setminus \{y\}$, $y \sim \mathcal{U}(\mathbf{y})$

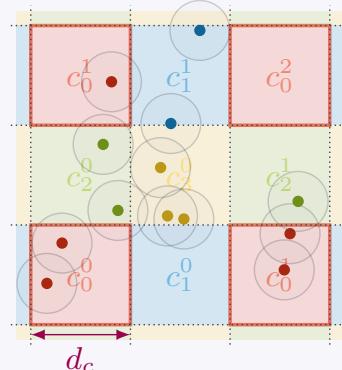

Diffusion

$$\mathbf{y}_{t+1} \leftarrow \mathbf{y}_t + \gamma \nabla_{\mathbf{y}_t} U(\mathbf{y}_t, \mathbf{X}, \boldsymbol{\theta}) + \mathcal{N}(0, 2\gamma T_t)$$

Energy gradient Noise

Parallel sampling

Same color cells sampled in parallel

Results Interpretability

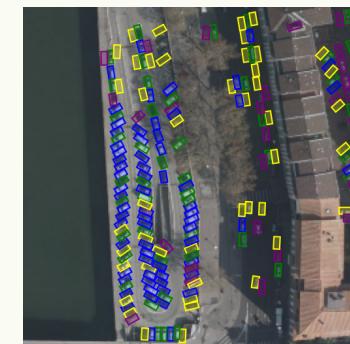

Novel scoring function
taking into account interactions

$$s(y|\mathbf{y} \setminus \{y\}, \mathbf{X}) = s_{\text{data}}(y|\mathbf{X}) s_{\text{prior}}(y|\mathbf{y} \setminus \{y\})$$

detection score

coherence w.r.t.
the image
