HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

A baseline for material flow models of French agri-food supply chains

SS14 - Social metabolism and agrarian and food transitions: articulating analysis and social transformation

Courtonne, Jean-Yves (STEEP, Université Grenoble Alpes, CNRS, INRIA, Grenoble, France); Pannier, Alexandre (TerriFlux, Moirans, France); Alapetite, Julien (TerriFlux, Moirans, France); Levert, Fabrice (SMART, INRAE, Rennes, France); Duflot, Boris (Institut de l'Élevage, Paris, France); Levet, Anne-Laure (Centre Technique Interprofessionnel des Fruits et Légumes, Paris, France); Galibert, Amandine (LESSEM, Inrae, Grenoble, France); Madelrieux, Sophie (LESSEM, Inrae, Grenoble, France; SELMET, Cirad/Inrae/SupAgro, Montpellier, France)

This communication is an outcome of two research projects funded by Ademe and FranceAgriMer. The SCALABLE project aimed at characterizing material and organizational vulnerabilities of agri-food systems at local level (the Grenoble urban area) and at the national level, relying on socio-metabolic approaches. The goal of the REFFLUX project was to produce a baseline of MFA models for French agri-food supply chains, to be used by professionals, public institutions and scientists. It involved 7 agriculture technical institutes representing 10 supply chains, two consultancies (TerriFlux and Le Basic) and a scientific advisory board.

Ten supply chain models were designed (cereals, oil crops, fruits and vegetables, bovine meat, poultry meat, pork meat, horse meat, horse livestock, dairy, eggs), computing a total of over 19000 flows. The steps were the following: (i) representing the supply chain structure (with a bipartite graph), (ii) gathering data on flows and on coefficients, (iii) reconciling the data, (iv) analyze results with supply chain experts and iterate in order to improve the models. Key features are the use of hierarchies for products and sectors (multiple level of details), computation of intervals for under-determined flows (when there is not enough information, we provided min-max flow values) and multi-unit reconciliation of the dairy chain (in raw mass, proteins and fat mass).

The main deliverables are : (i) excel files detailing the input data, hypotheses and model results, (ii) a set of 38 “views”, that is, “simplified” Sankey diagrams built to answer specific questions raised by stakeholders (available here : <https://www.filarmonici.fr/resultats-du-rmt/diagrammes-de-flux>), (iii) the publication of a baseline of coefficients (for both market and transformation processes), in the same vein than FAO’s Technical Conversion Factors document (published in the 90’s).

Finally, a typology has been drawn up to characterize the degree of openness of each value chain, based on production, import, consumption and export ratios. It identifies 9 theoretical types (e.g. producing-exporting chain vs. producing-consuming chain) which served as reference points to classify the French agri-food supply chains. For example, the dairy sector is closest to the “producing-consuming” type, with production accounting for 77% of supply and domestic consumption accounting for 72% (in mass of useful dry matter).

A study was also conducted at the scale of the Grenoble area. Three supply chains (dairy, cereals, bovine meat) were analyzed based on interviews and workshops with stakeholders in order to understand their perception of vulnerabilities and to what extent our results can modify these perceptions. Mentioned vulnerabilities include access to water, land and energy, labour availability, sustainability of farms (economic viability as well as labour conditions and social image), sustainability of transforming industries, and trends of declining consumption of animal proteins. On the contrary, vulnerabilities related to supply chain interactions were not mentioned, e.g. the link between the dairy and meat supply chain which share slaughterhouses. Agriculture project managers working for the local administrations underlined that they had a rather good previous knowledge on short supply chains but almost no knowledge on long, integrated, chains, which are in fact which nevertheless represent the largest volumes.

The consortium is already thinking about how to follow up on this knowledge base, both at the national level (e.g., connection with existing international flow models such as FABIO, extended footprint analysis...) and at the local level in partnership with other public initiatives.
