HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers. L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Managemen Networks	t of Dynamic & Services	
A sample of candidate tec	hnologies and a case study

Emerging alternatives

Summary

Tutorial Outline	JMX : Java Management Extensions
 Growing Dynamics and their Impact on Management (20 minutes) Dynamics Collapsing time scales The need for automation and autonomy Management solutions for the dynamic world Standardized approaches Emerging alternatives JMX: Dynamic Management for/through the Java World (60 min) Basic Concepts Dynamic components Adnoc networks management for/throute, method & notification tevel Managed Object level Remoting Implementations Application domains & instrumentation patterns 	 Why JMX in a tutorial on Management of Dynamic Networks and Services ? Used in dynamic service environments Inspired misuses ! Interesting features : Multi-level dynamics Great learning curve Part of the evolution of the management species Strong heritage from the management roots Excellent Open Source implementations
IADYNES 2003 - 15 -	@ MADYNES 2003

JMX : Java Management Extensions Java-based Management Agent Architecture - Enables Java applications/components to be easily instrumented in Java - Fosters the use of the Java technology to manage non-Java environments Information Models - Set of MBean objects Managed Objects - Name + MBean X.500 like naming – But not exactly the same ! Decoupling of instrumentation / export / access protocols @ MADYNES 2003 17

JMX : agent services

- MBeans container
- Ensures MBeans naming & registering
- Advanced services
 - Monitoring
 - Objects attributes
 - Numerical values & character chains
 - Timer
 - Periodical, « one shot »
 - MLet
 - Dynamic loading of MBeans
 - Query
 - Selection operation on MBeansOSI style Scoping & Filtering
 - Relationship
 - Setup and maintain relationships among managed objects

23

@ MADYNES 2003

JMX : event model	
 Events are part of the JMX model Are thus well integrated in the framework Are used in many fundamental services of the framework Java's Event/Listener Model Emitters Broadcaster interface Event consumers Subscription & listeners Done within one MBean Server 	public class StandardPrinter implements PrintertMBean, NotificationListener { public void handleNotification(Notification notification, Object handBack) (System out.println(notification getMessage();)
© MADYNES 2003	- 24 -

JMX : event components

Notification (CL can be subclassed)

- type: character string which defines the notification type ex. fr.loria.office.fire
- seq number: in the context of the source
- Time stamp
- message: string describing the cause
- userData: additional data provided by the sender (Java Object)

NotificationListener (IF)

- handelNotification(Notification n, Object handback)
- NotificationFilter (IF)
- isNotificationEnabled (invoqué par le broadcaster)
- NotificationBroadcaster (IF)
 - getNotificationInfo: lists all notifications that the source can send
 - add/RemoveNotificationListener
 - sendNotification

JMX & related proposals in the JCP

JMX Instrumentation Pattern [KregerHW 03]

- MyApplication implements.... MBean
- Usually Standard, Open or Dynamic MBeans
- MBean life-cycle usually bound to the application life-cycle & conversely
- Application is separated from its MBean(s) 1 -n MBeans represent the application
- Model MBeans are well suited
 Especially due to the services they offer
- All other (standard, dynamic, open) as well
- MBean Life-cycle can be independent of the application (depends on who instanciates the MBean)
- 2 additional Instrumentation Patterns defined in [KregerHW 03
- Publish-only
 - MBeans used to offer read-only data information to the management console with a well constrained overhead

- 31

- · Data caching is needed... ModelMBeans can do the work
- Facades
 - MBean that aggregates interfaces to other (even remote) MBeans

® MADYNES 2003

JMX Dynamics (1)

JMX Dynamics (2)

- Remote dynamic loading of MBeans
 - Using the MLet service
 - Well designed for
 - delegation
 - · Managament interface update

JMX Dynamics (3) Notification driven management orchestration - Every MO can be a notification emitter · Just become a notification broadcaster Every MO can subscribe to notifications Subsription on a per (source, notificationType) basis - Entire management behavior can be build on notification exchange · Even one MO can be a listener of its own broadcasted notifications and implement its behavior entirely in the listener © MADYNE5 2003 34

JMX Dynamics (4) : all together

- Fancy automated management scenarios are possible - Setup a listener on the create/delete & registration of MBeans
 - When a specific MBean appears
 - · Remote load the corresponding monitoring MBean
 - Manage the application

This is Autonomous Management !

- JMX Security (1) Access control
- Full part of JMX 1.2
- Permission-based access control
- MBeanServer permission policies
 - What operations of the MBeanServer are allowed to which application
 - · create an MBeanServer in/outside a MBeanServer factory
 - Release an MBeanServer
 - Find an MBeanServer
 - Get/set a builder
 - Grant given to applications
 - Implemented in the MBeanServerPermissionClass

grant MyApplicationArchive.jar

sion javax.management.MBeanServerPermission "findMBeanServer releaseMBeanServer'

@ MADYNES 2003

35

© MADYNES 2003

JMX Security (1) Access control

MBean level operations under permission policies Instanciation, register/de-register Instance & name search, get, guerving - Add/remove NotificationListener MO Attributes get/set - MO Metadata access (MBeanInfo) - Operation invocation Class Loader reference MBeanPermission Target - ClassName of the MBean to which the policy applies - ClassMember to which the policy applies (attribute, operation) - ObjectName to which the policy applies grant MyApplicationArchive.ja permission javax.management.MBeanPermission "StandardPrinter", "instanciate registerMBean" register meeur, permission javax.monagement.MBeanPermission "StandardPrinter:reset", "invoke"); permission javax.monagement.MBeanPermission "StandardPrinter:Status", "permission javax.monagement.MBeanPermission" StandardPrinter:Status", "permission javax.monagement.MBeanPermission" StandardPrinter:Status", "permission", permission javax.monagement.MBeanPermission" StandardPrinter:Status", "permission", permission javax.monagement.MBeanPermission", "StandardPrinter:Status", "permission", permission javax.monagement.MBeanPermission", "StandardPrinter:Status", "permission", "permission", "permission", "permission", "StandardPrinter:Status", "permission", "setAttribute"); ® MADYNES 2003 37

JMX Security (3)

MBean Trust

- Grant trust to MBeans signed by an authority
- Only trusted MBeans can register in the server
- Security violation => SecurityException
- Uses the Java security services
 - Java Authentication & Authorization Service (JAAS)
 - User authentication
 - Access control to methods & objects
 - Simple Authentication & Security Layer API

38

- Java Secure Socket Extension
 - TLS & SSL implementation

© MADYNE5 2003

JSR 160's goals From the text: "interoperability, transparency, security, and flexibility." Standardizes at least one protocol between client and agent (over RMI) client independancy from agent implementation support (sun, MX4J, ...) Remote client side operations mostly like local Mbean server interface ones Client Client Connection Server Connection Client Client Server Connection Client Client Server Client Client Server Client Serv

Notification handling (1)

- · Client/Server context: where are things done ?
 - Filtering: on agent (⇒serialization occurs)
 - Listeners on manager
 - Handback data on manager (usual case)
 - State data linked on Connector connection ("session")
- On client Add/remove Listener: <listener ref, filter ref, handbackdata ref, ObjectName>
 - Filter serialization \Rightarrow dedicated ListenerID management
- Implemention hints in JSR160: global Notification buffer linked to a given JMXConnectorServer
 - Remote fetch method in a JMXConnect (client) scope

@ MADYNES 2003

Notification handling (2)

Implementations

- A mandatory RMI implementation
- A generic Connector: « pluggable transport »
- JMX Message Protocol (JMXMP)
 - Optional in conformant implementations
 - A « meta » transport protocol
 - Handshake phase and profil negociation (I.e: type of authentification)
 - Messages and interactions are clearly described
 - Object wrapping (serialization) is hookable
 - Not mandatory

- Concrete sample implementation

- Full duplex stream oriented communication interface over TCP
- If you have time during your next vacation :
 - Do the SOAP implementation of JMXMP?

@ MADYNES 2003

JSR 160 : Summary

• +++++

43

45

47

- Very clear and precise specification
- HTTP connectors are no longer part of the standard
- Generic notification subscriber
 Server connector subscribes to all possible MBean broadcasters that appear in a MBeanServer

What is not detailled

- Security aspects
 - Use of security subject for some interactions
- Classes loading issues
 - On manager side (how to ensure which class loader does a JMXConnector use ?)
 - On agent side
 - MBean do not need to know all possible Filter class
 - How to ensure which class loader does a JMXServerConnector use ?
- All we forgot ;-) ...

© MADYNES 2003

Usefulness for Dynamic Networks

Connectors are MBeans + Mlet ⇒

Management infrastructure connectivity is easily configurable

- E.g. dynamic download & setup of connectors can be context specific !
- Still a bootstrap issue
 - RMI is there to solve the problem
- Better security support

© MADYNES 2003

JMXP : pros & cons	
 An excellent initiative A first proposal of a BEEP-based management protocol Notification subscription Good to have it available ! Missing items No Filtering, scoping in the JMXP parameters « The Blues Brothers » syndrome No Notification Type based subscription in the current approach	
9 MADYNES 2003	БЛ

<u>JMX : + &</u>

- Many Javavores, & some OSIrists Result:
- - OSI management without its limits
 - An Agent-toolkit
 - Trivial in usage (Ideal learning curve)
 Easy to integrate (Especially if the application is in Java)
 - High quality OpenSource implementations
 - ...especially MX4J et MC4J, TMX4J, ...
 - Outstanding Documentation
 - Specs & books & examples
- **Real Support of Dynamics**
- Any limits ?

.

- No neutral information model specification & language
- · Well : Java is one and a link to UML is always there
- Agents (or at least the agent part of an application) are necessary in Java ... I like that
- Client (Manager) side or at least remote access (remoting) took time to appear (JSR 160) Now proprietary approaches are deployed (interoperability ?)
 - The specification took time but the standard is of great help and very well described

Challenges in Device Management

Requirements for Device Management

- · Operate effectively over wireless and wired networks
- Support a variety of transport protocols
- Support arbitrary networked data
- Enable data access from a variety of applications
- · Address the resource limitations of the mobile device
- Build upon existing Internet and Web technologies

@ MADYNES 2003

Wireless/Wired Network Operations Transport Protocols Several transport protocols are already used by wireless devices Ubiquitous wireless access **Redefine Management** • HTTP (i.e. the Internet) High network latency 1. 1. Management might be to late • WSP (the Wireless Session Limited bandwidth 2. Manage efficiently (whenever 2. Protocol, part of the WAP it's required without wasting Low reliability of both data 3. protocol suite) and connectivity resources) OBEX (i.e. Bluetooth, IrDA, and **Connection Oriented** 4. Dynamic Addresses and 3. other local connectivity) network connectivity management Pure TCP/IP networks 5. Firewall. Nats - several 4. Application level naming and Proprietary wireless addressing management domains communication protocols 5 Device initiated management 6. Out of coverage factors 6 Different Fault behavior management All of them are connection oriented

Scope of SyncML XML based framework for data synchronization Message oriented data exchange protocol Transport agnostic Universal deployment Extension for device management

Multiple Applications

- Allow common data representation
 - Common personal data formats, such as vCard, todo etc.
 - Collaborative objects Relational data
 - HTML documents
 - Binary data
- Support extensions towards new data formats

Programming Language Independent

- No API (re) definition
- No Communication Middleware dependency
- XML Message exchanges as a glue

- 65 -

62.

S	tatus Codes (excerpts)	
	Add	
	 (200) OK : Command Completed successfully 	
	 (414) URI in command too long 	
	 (500) Command failed –generic code for failures 	
•	Atomic	
	 (507) Error occurred when performing an individual command 	
•	Сору	
	 (420) Device Full – no space left on device 	
	 (425) Permission Denied – no proper ACL 	
•	Delete	
	 (425) Permission Denied – no proper ACL 	
	 (403) Forbidden –node in use 	
1.	Each command is associated to one or several status codes	
2.	If you know HTTP then you almost know the Status codes	

Command Elements –functional classification

Data Command Elements – used to change application data

 Add - creates a new interior node
 Copy –copies values from a node to another at the client side
 Delete – deletes a node (and all its subnodes)
 Exec – process execution on the target
 Replace – overwites value for an existing node
 Get – retrieves data from the target

 DataStore Command Elements – Actions for an entire datastore

 Alert – used for notifications, text displays
 Results – contains results from a Get

 Process Flow Commands – enhanced processing control

 Atomic – all subcommands must be executed
 Sequence – subcommands must be executed in order

Data Description Elements
 <data></data> encloses SyncML payload data <item></item> isolates a command from the underlying data Contains Data, Identification and Metadata <meta/> provides meta-information about the data Type of the data Size of the data
Heta Data

Device Management Framework

Describes the management information and how to access it

Modeling Management Information in SyncML

ACLs vs AccessType ACL is Runtime property – AccessType is a device framework property AccessType specifies what operations are supported - the ACL specifies who is allowed to perform these operations · ACL - AccessType interaction in case of dynamic (runtime created) nodes Direct Delete Indirect Delete Command Command Deleted Deleted Delete allowed Access Type Delete not allowed Not deleted Deleted

Indirect delete occurs when an ancestor of the node has to deleted

@ MADYNES 2003

Approach for the Device Management Protocol Objective: Perform Device Management and allow user interaction in the management process Features Use the Representation Protocol Re-use security framework from the Synchronization Protocol Un-symmetric since only a server manages a client <Renlace> <CmdID>1</CmdID> <Meta> ...</Meta> Management Functionality : <ltem> <Target> 'URI of MO.....</Target> <Data>'New value for MO'</Data> Read/Write/Replace Managed Object </ltem> properties </Replace> Create Managed Object Remove Managed Object

Management goes on

Existing Implementations

Proprietary implementations :

Major actors and contributors to the standard.

Open Source :

Sync4J (http://sync4j.sourceforge.net) for the data synchronization. No device management functionality.

LORIA/MADYNES :

SyncML toolkit available : http://www.madynes.org/software.html

SyncML DM summary				
 SyncML DM is more than just XML based configuration Framework for describing management information A set of standard Managed Objects Transaction oriented Management Protocol Network level transport agnostic Flexible Access Control Adaptation of conceptual design approaches from the SNMP framework towards device mobility Similar building blocks to the SMI, MIB2 and SNMP and Get/Set semantics Reversed roles : a managed Device initiates a management session Power for the users : allow/deny management actions More OpenSource implementations Interoperability studies Performance analysis and large scale deployment tests 				

101

Menu

ANMP : Ad hoc Network Management Protocol [ChenJS of

Focused functions

- Configuration management
 - Network partitions, merge
 - · Node connect, disconnect, Join, leave, death, birth, power on/off,
- Fault Management
- Monitoring (Data collection)
 - · Manager rooted Spanning tree for polling
 - Trap-based update (on change data propagation) - Limit the communication on data change

ANMP architecture & solution 3 level management hierarchy Top-level Manager · Can be an agent towards a wired manager Cluster heads (1st level agents & Managers) SNMP compatibility - Data is exchanged via SNMP compatible PDUs 0 - Managament information is located in SNMP MIBs · Clusters of neighbors - 2 clustering algorithms · Graph-based clustering algorithm One hop neighbors (direct) · Geographical clustering algorithm Up to 3 hop neighbors in a cluster @ MADYNES 2003 108

107

100

ANMP Agent Information

- Information Update Interval (ms)
- %managed agents, %managed agents updated info available
- Data collection tables (control + data tables)
 - Managed nodes power information

 Control : number of samples stored, to be measured, sampling
 - interval,

M2M notification communication facility

- Manager configures events to be sent by the cluster heads
- Manager delegates monitoring (e.g. threshold monitoring) to clusterheads, through setting the control tables
- Clusterhead selected alarm can lead to event issuance to the manager

@ MADYNES 2003

- 113 -

ANMP Security

- Level Based Access Control Model (LACM)
- · Each node has a Clearance Level
 - The Higher the level the lower the security access
 1 : access granted to manager with level 0 clearance certificates
 4 : access granted to manager with level 0,1,2,3
 - Clearance Ids are certificates
 - Clearance lds are distributed by the manager to the nodes
 - Data (mib objects) is grouped into projects
 - Each project (set of managed objects) has a clearance level which defines who can access it

· LACM effect on clustering

- Cluster heads should have clearance to access managed nodes data
- If Not, they are always bypassed by the node
 Node encrypt data so it can only be decrypted by the manager

© MADYNES 2003

ANMP : Summary

Management Architecture for ad hoc networks A very complete SNMP compatible management architecture proposal Good information models Goals : make management operational in highly dynamic networks A first identification of a need for some active code facility ftp download of code. - Maintain connectivity in the management plane within a managed ad Association of the entry point of the code (function name) to alarms or event hoc network entries - Minimize Management costs on : An outstanding contribution to the field • CPU Interesting Clearance level based security model Memory Very good coverage of mobile ad hoc nodes Power consumption >90% cluster-level managed nodes - Enable Disconnected Management ! - No configuration transfert among clusterheads in cluster formation Approach · Everything is conditioned to manager operations - « Context-Aware » Self-configuration of the management plane Multicasting service usage not clear in the context of management No clear definition of the right cluster size and its relationship to the - Hierarchical Management Framework management operations - Management agency : a set of agents can speak as an agent for any E.a. monitoring frequency other Limited management functions - Dynamic code deployment on active probes Topology discovery, + power status & management @ MADYNES 2003 ® MADYNES 2003 115 116

Guerilla Management Architecture [ShenSJ 02]

GMA : Protocol components

- Connectivity & management plane topology
 - Nodes send beacons (hello's)
 - Nomadic Manager decides of its coverage domain
 - Can spawn a new nomadic manager to split a domain
 - Can rely on the Adaptive Dynamic Backbone clustering protocol for selfconfiguration of domains
 – Builds trees of nodes rooted in an Nomadic Manager
 - Maximum a utility function to select the management function to perform
 - U = f(powerUsage,CPU Load, ManagementGain, ...)

GMA : Management plane clustering algorithm

- · Relies on the CLTC algorithm
 - Initially a power management protocol
 - k connectivity with minimized power consumption power assignment
 - Cluster-based Topology Control
 - 2 level topology control
 - Intra-cluster
 - Inter-cluster heads
 - 3 phase power level calculation
 - 1 : clusters establishment
 - 2: intra-cluster power assignment
 - 3 : inter cluster power assignment
 - K connectivity enforcement among clusters

@ MADYNES 2003

GMA : Summary

- · A MbD approach
 - Topology & power dynamics
 - Code mobility
- Heterogeneous Devices considered
 ManagementRole = f(Device capacity)
- Fundamental Good Assumptions
- Self-organization of the management plane is necessary
 Disconnected management can be done
- Limits
 - So far no value-added management service deployed on the framework
 - Except the management of the management plane topology itself
 - Scalability issues are not convincing yet
- Open Questions
 - Why do we still need a manager ?

@ MADYNES 2003

Clustering

K-Clustering

- Maximum K hops away from a policy server
- A client can be served by a server that is less than k-hops away
- Initial Deployment
 - Super PDPs are present in the network
- · Redirection service
 - A server (PDP) can dynamically redirect a client to a less distant PDP
 - Redirection is Server initiated

Delegation Service

 A PDP can delegate part of its decisions to another PDP

@ MADYNES 2003

N2N Policy exchange approach

- Summary
 - A focused approach
 Corporate
 - An interesting approach
 - Device level Policy Management Framework
- Current limits
 - Synchronization protocol not described
 - Some open problems on policies consistency
 - No description of addressed policies & policy levels
 - Hierarchical authority model is not sufficient to cover security issues at all !

@ MADYNES 2003

Ad hoc management summary

- Other approaches
 - MARE
 - · Used mainly for service location
 - Mobile agents + distributed tuple-space
- Common vision of the problems
 - Management overhead must be minimized
- · Similar approaches
 - Clustering (various algorithms)
 - Delegation (agents, active code, extensible SNMP agent, ...)

128

© MADYNES 2003

- 127

Conclusion (3) : The management future according to MADYNES Management will not disappear ! At least we hope it will not. The management future will be a mixture of : (option 1) management of static only parts (option 3) smart & automated management techniques Efforts must be maintained in both directions Standards can play a role in both options as well But are not the overall success condition Research may be more "sexy" in option 3 Covers & integrates potentially many fields & techniques
