I ever rest a lover of all them that love the Mathematickes

Henry Briggs, preface to [69]

## 1 Briggs' first table of logarithms (1617)

Henry Briggs (1561–1631)<sup>1</sup> is the author of the first table of decimal logarithms, published in 1617, of the first extensive table of decimal logarithms of numbers (1624), and of the first extensive table of decimal logarithms of trigonometric functions (1633).

After having been educated in Cambridge, Briggs became in 1596 the first professor of geometry at Gresham College, London [106, p. 120], [96, p. 20], [118]. Gresham College was England's scientific centre for navigation, geometry, astronomy and surveying.<sup>2</sup> Briggs stayed there until 1620, at which time he went to Oxford, having been appointed the first Savilian Professor of Geometry in 1619 [96, p. 24].

While at Gresham College, Briggs became friends with Edward Wright. He also seems to have spent time doing research in astronomy and navigation [96, pp. 29–30]. Briggs had in particular published several tables for the purpose of navigation in 1602 and 1610 [119]. Several of Briggs' tables were published under the name of others [96, p. 8].<sup>3</sup>

In 1614, John Napier (1550–1617) published his *Mirifici logarithmorum canonis descriptio*, the description of his table of logarithms [68, 89]. It is through this work that Briggs was early exposed to the theory of logarithms. After Napier's publication, Briggs went to visit him in Scotland in the summers of 1615 and 1616 and they agreed on the need to reformulate the logarithms, a task that Briggs took over.

Briggs published his first table of decimal logarithms in 1617 [9, 82]. It was a small booklet of 16 pages, of which the first page was an introduction, and the remaining 15 pages were tables. Briggs' table gave the decimal logarithms of the integers 1 to 1000 to 14 places.

## 2 The *Arithmetica logarithmica* (1624)

Seven years after his first table of logarithms, Briggs published his *Arithmetica logarithmica* which gave the logarithms of the numbers from 1 to 20000 and from 90001 to 100000 with 14 decimals [10].<sup>4</sup>

Some copies of Briggs' table also contain an appendix with the logarithms of the interval 100000–101000, but as we haven't seen it, we do not reproduce it here.<sup>5</sup> For a description of these extra sheets and their use, see Malcolm [61, pp. 303–305].

---

<sup>1</sup>Briggs was baptized on February 23, 1560 (old style), which is 1561 new style. He died on January 26, 1630 (old style), which is 1631 new style [51].

<sup>2</sup>Gresham College was a very fluctuating institution, and the main reason for its claim to scientific responsibility was the work and influence of Briggs. The flourishing period of Gresham College ended with the death of Henry Gellibrand in 1636 [2, p. 20].

<sup>3</sup>For more biographical information on Briggs, consult Smith [94], Ward [106], Sonar [96] and Kaunzner [52]. Sonar gives an overview of Briggs' works prior to his tables of logarithms [96].

<sup>4</sup>A copy of the *Arithmetica logarithmica* can be found on *google books* (id: L88WAAAAQAAJ).

<sup>5</sup>One example, among others, is appended alone to the French edition of Vlacq's *Arithmetica logarithmica* located at the Harald Cohen Library of the University of Liverpool (call number SPEC RYL.P.2.12) [29].

Although scarce now, it seems that Briggs' book was printed in (relatively) too many copies, so that it could be obtained in the streets of London for a very small price [36, pp. 381–382].

### 3 Briggs' methods

In order to compute decimal logarithms, Briggs considered several methods, each method making it possible for him to move a step further.<sup>6</sup>

#### 3.1 Square roots

A straightforward way to compute new logarithms from existing ones is to use the square root. For instance, if  $\log n = a$  and  $\log m = b$  are known, then  $\log \sqrt{mn} = \frac{a+b}{2}$ . The use of square roots had already been alluded to by Napier in his *Construction*, to which Briggs added some comments [72].<sup>7</sup>

Briggs used this method as follows. He first considered the logarithms of  $\sqrt[n]{10}$ . Their values are actually very easy to compute:

$$\begin{aligned} \log 10 &= 1 \\ \log \sqrt{10} &= 0.5 \\ \log \sqrt[4]{10} &= 0.25 \\ &\dots\dots \\ \log \sqrt[2^n]{10} &= 2^{-n} \end{aligned}$$

Briggs computed these values until  $n = 54$ , with 32 decimal places for the last values of the roots and 40 decimal places for the last values of the logarithms [10, pp. 10–11]. The last entries of his table are

$$\begin{aligned} 10^{\frac{1}{2^{52}}} &= 1.00000\ 00000\ 00000\ 51127\ 65972\ 80129\ 47 \\ 10^{\frac{1}{2^{53}}} &= 1.00000\ 00000\ 00000\ 25563\ 82986\ 40064\ 70 \\ 10^{\frac{1}{2^{54}}} &= 1.00000\ 00000\ 00000\ 12781\ 91493\ 20032\ 35 \end{aligned}$$

whose logarithms are

$$\begin{aligned} \frac{1}{2^{52}} &= 0.00000\ 00000\ 00000\ 22204\ 46049\ 25031\ 30808\ 47263 \\ \frac{1}{2^{53}} &= 0.00000\ 00000\ 00000\ 11102\ 23024\ 62515\ 65404\ 23631 \\ \frac{1}{2^{54}} &= 0.00000\ 00000\ 00000\ 05551\ 11512\ 31257\ 82702\ 11815. \end{aligned}$$

---

<sup>6</sup>Various overviews of Briggs' methods have been published, for instance by Delambre [20], Hutton [48], and others [26, 25], and the reader is directed to our bibliography for further information.

<sup>7</sup>Some authors have oversimplified Briggs' method and presented Napier's use of square roots as Briggs', see for instance Abellan [1]. On the other hand, it is obvious that Briggs' methods were the results of Napier's and Briggs' exchanges during Briggs' visits to Scotland.

Briggs stopped extracting roots as soon as the digits of  $\sqrt[2^n]{10}$  after the unit were exactly halved from one root to the next. Briggs in fact computed some decimals more, but his main table contains the values above. The number of significative digits of the last square root after the zeros is slightly more than the 15 digits Briggs needed for his table.

Briggs realized that when  $x = 1 + r$  is close to 1, then  $\log x \approx 1 + \alpha x$ , where  $\alpha$  is some proportionality factor that he sought to determine.<sup>8</sup> By a mere proportion (the so-called “golden rule”), Briggs found that

$$\alpha \approx \frac{55511151231257827021181583}{127819149320032344165000000} \approx 0.434294481903251804.$$

Briggs’ result is correct given the two values he divided, but it is only accurate to 16 places with respect to the value sought which is

$$\frac{1}{\ln 10} = 0.43429448190325182765 \dots$$

Now, if  $\sqrt[2^n]{x} = 1 + r$  and  $\log(1 + r) \approx \alpha r$ , then  $\log x \approx 2^n \alpha r$  and this gives a way to compute the logarithm of  $x$ , by successive square root extractions.

The accuracy of the result can easily be estimated. Let  $r'$  and  $\alpha'$  be the significative parts of  $r$  and  $\alpha$ . We can assume  $0.1 \leq r' < 1$  and  $0.1 \leq \alpha' < 1$ . If  $r'$  and  $\alpha'$  have 18 exact (rounded) significative digits, the error on each value is less than  $5 \cdot 10^{-19}$ , hence their product will be wrong by at most  $10^{-18}$ . The product will have more than 16 exact (rounded) significative digits and usually at least 17. Since  $2^n$  is computed exactly,  $\log x$  can be computed with 17 exact (rounded) significative digits.

Of course, computing these square roots was tedious. It will therefore not be a surprise to discover that Briggs made a computation error in his 54 square root extractions, but this error happened to have no consequences, contrary to Napier’s error in the construction of his tables. It must also be observed that Briggs computed the roots with more decimals than he really needed. His value of  $\sqrt{10}$  was given to 26 decimal places, but he would have obtained the same final digits for the 54th root if he had kept only about 17 decimal places of  $\sqrt{10}$ . This follows easily if we write  $\sqrt{10} = a + b$ , where  $b < 10^{-17}$ :

$$10^{\frac{1}{2^{54}}} = (a + b)^{\frac{1}{2^{53}}} = a^{\frac{1}{2^{53}}} \left(1 + \frac{b}{a}\right)^{\frac{1}{2^{53}}} = a^{\frac{1}{2^{53}}} \left(1 + \frac{1}{2^{53}} \frac{b}{a} + \dots\right)$$

We have

$$\frac{1}{2^{53}} \frac{b}{a} < 3.51 \dots \cdot 10^{-33}$$

and therefore there are about 33 correct decimal places in  $a^{\frac{1}{2^{53}}}$  which is what Briggs eventually obtains. A more detailed analysis of Briggs’ errors is given by Ian Bruce in his notes to the translation of the *Arithmetica logarithmica*.<sup>9</sup>

<sup>8</sup>Whiteside’s account in that respect is historically inaccurate, as he writes that Briggs observed that for small  $x$ ,  $\log_e(1 + x) \approx x$  [108, p. 10].

<sup>9</sup>See <http://www.17centurymaths.com>.

### 3.2 Shortcuts and logarithms of the first primes

After the first series of square root extractions, Briggs continued with the computation of  $\log 2$  [10, pp. 12–15]. He introduced a faster method. Instead of starting with the square root of 2, he found a power of 2 which was close to a power of 10. He took  $1024 = 2^{10}$  and divided this number by 1000. Then, he computed the logarithm of 1.024 using the method of the previous section. He extracted the root 47 times and obtained

1.00000 00000 00000 16851 60570 53949 77

the exact value being

1.00000 00000 00000 16851 60570 53949 7663 . . .

The 47th square root is in the area in which Briggs considers that  $\log(1+x) \approx \alpha x$ . If Briggs had started with 2, he would have extracted the square root 52 times, so in this case he was able to save five square root extractions.

Once Briggs had the last square root, he could compute the value of the logarithm using  $\alpha$  and the “golden rule.” He found

0.00000 00000 00000 07318 55936 90623 9368

the exact value being

0.00000 00000 00000 07318 55936 90623 933137

From that, Briggs obtained

$\log 1.024 \approx 0.01029 99566 39811 95265 27744$

and then

$\log 1024 \approx 3.01029 99566 39811 95265 27744$

and this is  $10 \log 2$ , hence

$\log 2 \approx 0.30102 99956 63981 19526 527744$

This value is correct to 19 decimal places.

Once Briggs had the value of  $\log 2$ , he easily obtained  $\log 5$ , given that  $\log 1$ ,  $\log 2$ , and  $\log 10$  were known:  $\log 10 - \log 5 = \log 2$ , hence

$\log 5 = 1 - \log 2 \approx 0.69897 00043 36018 805$

Briggs then computed  $\log 3$ . He started with  $6^9 = 10077696$  and applied the method which he used to compute  $\log 2$ . Eventually, he found  $\log 6 \approx 0.77815 12503 83643 63$  and

$\log 3 = \log 6 - \log 2 \approx 0.47712 12547 19662 44$ .

### 3.3 The use of finite differences

In the next chapter of the *Arithmetica logarithmica*, Briggs expounds another method in order to ease the computation of the square roots [10, pp. 15–17].<sup>10</sup> After having extracted many roots, Briggs obviously noticed some patterns. Using modern notations, we can easily express them. Let  $y_0$  be the initial number,  $y_1 = \sqrt{y_0}$ ,  $y_2 = \sqrt{y_1}$ , etc. Then, we set  $y_n = 1 + A_n$ . Briggs called the values of  $A_n$  the first differences.<sup>11</sup>

As shown above, Briggs had noticed that when  $A_n$  is small,  $\log y_n \approx \alpha A_n$ . Moreover,  $A_{n+1} \approx \frac{A_n}{2}$ . This of course follows from  $\sqrt{1+x} = 1 + \frac{x}{2} + \dots$ , but Briggs didn't know this series expansion.

Once this pattern had been noticed, it was natural to see how much  $A_{n+1}$  was differing from  $\frac{A_n}{2}$ , and therefore Briggs considered the “second”<sup>12</sup> differences  $B_{n+1} = \frac{A_n}{2} - A_{n+1}$ . Briggs then noticed that  $B_{n+1} \approx \frac{B_n}{4}$ . In other words, Briggs noticed that

$$\frac{y_n - 1}{2} - (y_{n+1} - 1) \approx \frac{\frac{y_{n-1} - 1}{2} - (y_n - 1)}{4}$$

This follows easily, if we set  $y_{n-1} = 1 + x$ . Then,  $y_n = \sqrt{y_{n-1}} = 1 + \frac{x}{2} - \frac{x^2}{8} + \dots$  and  $y_{n+1} = \sqrt{y_n} = 1 + \frac{x}{4} - \frac{3x^2}{32} + \dots$ , and the previous approximation is equivalent to

$$\begin{aligned} \frac{x}{4} - \frac{x^2}{16} + o(x^2) - \left( \frac{x}{4} - \frac{3x^2}{32} + o(x^2) \right) &\approx \frac{x}{8} - \left( \frac{x}{8} - \frac{x^2}{32} + o(x^2) \right) \\ \frac{x^2}{32} + o(x^2) &\approx \frac{x^2}{32} + o(x^2) \end{aligned}$$

but Briggs still only had an experimental approach.

Briggs then went on and considered the third differences  $C_{n+1} = \frac{B_n}{4} - B_{n+1}$  and he noticed that  $C_{n+1} \approx \frac{C_n}{8}$ . Afterwards, he noticed that  $D_{n+1} \approx \frac{D_n}{2^4}$ ,  $E_{n+1} \approx \frac{E_n}{2^5}$ , etc. But he did not prove this result.

#### 3.3.1 Developments of $\sqrt{1+x}$

If we set  $x = A_n$ , we have

$$\begin{aligned} \sqrt{1+x} &= 1 + A_{n+1} \\ &= 1 + \frac{1}{2}A_n - B_{n+1} \\ &= 1 + \frac{1}{2}A_n - \frac{1}{4}B_n + C_{n+1} \\ &= 1 + \frac{1}{2}A_n - \frac{1}{4}B_n + \frac{1}{8}C_n - D_{n+1} \\ &= 1 + \frac{1}{2}A_n - \frac{1}{4}B_n + \frac{1}{8}C_n - \frac{1}{16}D_n + E_{n+1} \\ &= \dots \end{aligned}$$

<sup>10</sup>An overview of Briggs' method can be found in Sonar's book [96, pp. 197–201]. A more detailed analysis can be found in Hutton's survey [48, pp. 60–73].

<sup>11</sup>In this section, except for  $y_n$ , we use Ian Bruce's notations. Briggs actually only used  $A, B, C$ , etc., but following Bruce, we have added indices.

<sup>12</sup>These are of course not the second differences in the usual sense.

These equations can be extended into an infinite series, but we haven't proved that these series converge.

We can obtain developments of  $B_n$ ,  $C_n$ ,  $D_n$ , etc. in terms of  $x$ . Setting  $f(x) = (1+x)^2 - 1 = x^2 + 2x$ , we have:

$$\begin{aligned} B_n &= \frac{A_{n-1}}{2} - A_n = \frac{f(x)}{2} - x = \frac{x^2}{2} \\ C_n &= \frac{B_{n-1}}{4} - B_n = \frac{\frac{(f(x))^2}{2}}{4} - \frac{x^2}{2} = \frac{(x^2 + 2x)^2}{8} - \frac{x^2}{2} = \frac{x^3}{2} + \frac{x^4}{8} \\ D_n &= \frac{C_{n-1}}{4} - C_n = \frac{7x^4}{4} + \frac{7x^5}{8} + \frac{7x^6}{16} + \frac{x^7}{8} + \frac{x^8}{64} \\ E_n &= \frac{21x^5}{8} + \dots \\ F_n &= \frac{217x^6}{16} + \dots \\ G_n &= \frac{1953x^7}{16} + \dots \end{aligned}$$

Briggs actually gave these developments until  $J_n$  and up to the terms in  $x^{10}$  [10, p. 16].

We can analyze these expressions as follows. Setting  $\Phi_n^1 = A_n$ ,  $\Phi_n^2 = B_n$ ,  $\Phi_n^3 = C_n$ , etc., we define  $\varphi(n, k) = 1 + \sum_{i=1}^{k-1} (-1)^{i+1} \frac{1}{2^i} \Phi_n^i$ . Then  $\sqrt{1+x} = \varphi(n, k) + (-1)^{k+1} \Phi_{n+1}^k$ .

As indicated by the expansions of  $A_n$ ,  $B_n$ , etc., it seems that

$$\text{for all } k, \Phi_n^k = a_k (\Phi_n^1)^k + \dots \quad (1)$$

That this is so is actually easy to prove.<sup>13</sup> We can proceed by induction. Assume  $\Phi_n^k = a (\Phi_n^1)^k + b (\Phi_n^1)^{k+1} + c (\Phi_n^1)^{k+2} + \dots$  and note that  $A_{n-1} = f(A_n)$ , or, in other words,  $\Phi_{n-1}^1 = f(\Phi_n^1)$ . Then,

$$\begin{aligned} \Phi_n^{k+1} &= \frac{1}{2^k} \Phi_{n-1}^k - \Phi_n^k \\ &= \frac{1}{2^k} \left( a (\Phi_{n-1}^1)^k + b (\Phi_{n-1}^1)^{k+1} + \dots \right) - a (\Phi_n^1)^k - b (\Phi_n^1)^{k+1} + \dots \\ &= \frac{1}{2^k} \left( a (f(\Phi_n^1))^k + b (f(\Phi_n^1))^{k+1} + \dots \right) - a (\Phi_n^1)^k - b (\Phi_n^1)^{k+1} + \dots \\ &= \frac{1}{2^k} \left[ a \left( 2\Phi_n^1 + (\Phi_n^1)^2 \right)^k + b \left( 2\Phi_n^1 + (\Phi_n^1)^2 \right)^{k+1} + \dots \right] - a (\Phi_n^1)^k - b (\Phi_n^1)^{k+1} + \dots \\ &= \frac{1}{2^k} \left[ a \left( 2^k (\Phi_n^1)^k + \dots \right) + b \left( 2^{k+1} (\Phi_n^1)^{k+1} + \dots \right) + \dots \right] - a (\Phi_n^1)^k - b (\Phi_n^1)^{k+1} + \dots \\ &= a' (\Phi_n^1)^{k+1} + b' (\Phi_n^1)^{k+2} + \dots \end{aligned}$$

<sup>13</sup>In his article on Briggs' anticipation of the binomial theorem, Whiteside derives the binomial expansion by grouping the terms of the developments from the expansion of  $\sqrt{1+x}$ , but omitting the proof of the property (1) of  $\Phi_n^k$ . The proof is therefore not complete. For a comparison, note that Whiteside writes  $e_0$  for our  $A_n$ ,  $e_{-1}$  for  $A_{n+1}$ ,  $\Delta_0^1$  for  $B_n$ ,  $\Delta_0^2$  for  $C_n$ , etc.,  $\Delta_{-1}^1$  for  $B_{n+1}$ ,  $\Delta_{-1}^2$  for  $C_{n+1}$ , etc. Whiteside's  $\Delta_p^k$  is our  $\Phi_{n-1-p}^k$  [108].

We therefore have  $\frac{\Phi_n^k}{\Phi_{n-1}^k} \approx \frac{a_k x^k}{a_k f(x)^k} = \frac{a_k x^k}{a_k (2x)^k} = \frac{1}{2^k}$ , which is what Briggs noticed.

We also have  $\Phi_{n+1}^k = a_k \frac{x^k}{2^k} + \dots$  and therefore  $\varphi(n, k)$  contains all the terms  $x^i$ , for  $i < k$ . This is why  $\varphi(n, k)$  necessarily has the same development as the binomial expansion of  $\sqrt{1+x} = 1 + \frac{x}{2} - \frac{1}{8}x^2 + \frac{1}{16}x^3 - \dots$  up to  $x^{k-1}$ .

### 3.3.2 Backwards computation

Once Briggs had computed  $A_i, B_i, \dots$ , for  $i \leq n$ , he was able to use these values backwards to compute approximations of  $\dots, C_{n+1}, B_{n+1}$ , and  $A_{n+1}$ , and therefore having the next square root, with a less tedious computation.

Taking again the above developments of  $\sqrt{1+x}$ , the computation would proceed as follows:

$$\begin{aligned} E_{n+1} &\approx \frac{E_n}{2^5} & D_{n+1} &= \frac{D_n}{16} - E_{n+1} & C_{n+1} &= \frac{C_n}{8} - D_{n+1} \\ B_{n+1} &= \frac{B_n}{4} - C_{n+1} & A_{n+1} &= \frac{A_n}{2} - B_{n+1} \end{aligned}$$

Briggs applied this method when  $x$  was very small. Briggs could then compute approximations of the square roots without explicitly extracting these roots.

As an example, Briggs considered the extraction of the roots of  $\frac{6^9}{10^7} = 1.0077696$  [10, pp. 15–17]. Briggs first computed the first nine successive square roots:

$$\begin{aligned} &\dots\dots \\ &{}^2\sqrt{1.0077696} = 1 + A_4 = 1.00048\ 38402\ 68846\ 62985\ 49253\ 5 \\ &{}^3\sqrt{1.0077696} = 1 + A_5 = 1.00024\ 18908\ 78824\ 68563\ 80872\ 7 \\ &{}^4\sqrt{1.0077696} = 1 + A_6 = 1.00012\ 09381\ 26397\ 13459\ 43919\ 4 \\ &{}^5\sqrt{1.0077696} = 1 + A_7 = 1.00006\ 04672\ 35055\ 30968\ 01600\ 5 \\ &{}^6\sqrt{1.0077696} = 1 + A_8 = 1.00003\ 02331\ 60505\ 65775\ 96479\ 4 \\ &{}^7\sqrt{1.0077696} = 1 + A_9 = 1.00001\ 51164\ 65999\ 05672\ 95048\ 8 \end{aligned}$$

Using the computed values of  $A_4, A_5, A_6, A_7, A_8$ , and  $A_9$ , Briggs computed  $B_5, B_6, C_6, B_7, C_7, D_7, B_8, C_8, D_8, E_8$ , and finally  $B_9, C_9, D_9, E_9$ . The latter value being sufficiently small, the computation was then run backwards, first computing  $E_{10} \approx \frac{E_9}{32}$ , then  $D_{10}, C_{10}$ , etc. He then obtained  $A_{10} = 1.00000\ 75582\ 04436\ 30121\ 42907\ 60$ , the exact value being  $1.00000\ 75582\ 04436\ 30121\ 42907\ 64\dots$ . This procedure is carried out until  $A_{n+1} = \frac{A_n}{2}$  when restricted to Briggs' 32 significative digits.

As mentioned above, Briggs also gave the developments in  $A_n$  and he suggested to use them to compute  $A_{n+1}$ . Using  $A_n$ , Briggs could compute  $B_n, C_n, D_n$ , etc., and then compute  $A_{n+1}$  [10, p. 16]. This process can then be repeated and the sequence of square roots obtained.

### 3.4 Prime numbers

Using the previous methods, Briggs was able to compute the logarithms of 1, 2, 3, 5, 10 and all logarithms obtained from these by multiplication or division. Next, Briggs considered the logarithms of prime numbers [10, pp. 17–19].

Briggs assumed that the logarithms of numbers were known up to  $n$ , and he wanted to compute the logarithm of  $n + 1$ . In order to do so, Briggs found several arithmetical relations involving  $n + 1$  and integers whose logarithms are known.

For instance, in order to compute  $\log 79$ , Briggs considered the products:

$$a = 79 \times 18 = 1422,$$

$$b = 49 \times 29 = 1421,$$

$$c = 71 \times 20 = 1420.$$

Since  $a$ ,  $b$ , and  $c$  are consecutive, we have  $b^2 - 1 = ac$  and  $\frac{b^2}{ac} = 1 + \frac{1}{ac}$ . This number is close to 1 and its logarithm can be computed with the first method. From that,  $\log 79$  follows.

Briggs used this method to compute the logarithms of the primes up to 97. In the *Arithmetica logarithmica*, he gave all the triples  $(a, b, c)$  that he used [10, p. 18].

### 3.5 Fractions

In the chapter 10 of the *Arithmetica logarithmica* [10, pp. 19–21], Briggs considers the logarithms of fractions and obtains the equivalent of  $\log \frac{a}{b} = \log a - \log b$ , or, in Briggs' words, "if the logarithm of the denominator is taken from the logarithm of the numerator, there remains the logarithm of the fraction."<sup>14</sup>

### 3.6 Subtabulation

#### 3.6.1 Subtabulation using first differences (linear interpolation)

In the chapter 11 of the *Arithmetica logarithmica* [10, pp. 21–24], Briggs considers the subtabulation of logarithms, that is, the problem of finding logarithms between two values of a table, or of finding to which number corresponds a logarithm which is between two values in a table.

Subtabulation is an important means to compute new values of a table. For instance, if we divide the interval [9123, 9124] in ten subintervals, we will find approximations of the logarithms of 9123.1, 9123.2, etc., which do immediately provide approximations of the logarithms of 91231, 91232, etc.

Briggs observes that the increments  $\log(n + 1) - \log n$  become smaller when  $n$  gets larger, and that linear interpolation is more accurate for large values of  $n$ . Briggs illustrates the use of linear interpolation to find  $a = \sqrt{1200}$ . He first finds  $A = \log a = 1.539590\dots$ , then  $B = 2 - A = 0.460409\dots$ . If  $B = \log b$ , then  $ab = 100$ . Briggs finds  $c = 2886$  such that  $C = \log c = 3.46029\dots$  has a decimal part slightly smaller than that

---

<sup>14</sup>The original text reads *Si Logarithmus Denominatoris auferatur è Logarithmo Numeratoris, restabit Logarithmus Partium.*

of  $B$ . Therefore  $\log(ac) = \log a + \log c = 4.9998869497\dots$  is slightly smaller than 5 and  $ac$  is slightly smaller than  $10^5$ . Briggs finds  $h = 99973$  such that  $\log h$  is known and  $\log h < \log ac < \log(h+1)$ . Finally, the interpolation gives  $\frac{\log ac - \log h}{ac - h} \approx \log(h+1) - \log h$ . Briggs obtains  $ac \approx h + \frac{\log ac - \log h}{\log(h+1) - \log h} = 99973.9726\dots$  and then  $a \approx 34.64101615\dots$

As can be seen, Briggs has transferred the linear interpolation to the end of his table, where it is most accurate.

But Briggs' process is tedious when  $c$  is large and not composed of small factors. In order to simplify this process, Briggs constructed a table of numbers from 1024 to 9800, whose factors were only integers smaller than 10, together with their logarithms. Briggs used this table in an example where he computed the square root of 10800 [10, pp. 23–24]. He then needed to find a number whose logarithm had a decimal part close to 0.98328812225653 and he took 9600 whose logarithm is 3.98227123303957. When it comes to dividing by 9600, it is then much simpler than dividing by, say, 2886, which contains the factor 37.

### 3.6.2 Subtabulation using second differences

The 12th chapter of the *Arithmetica logarithmica* [10, pp. 24–27] is devoted to subtabulation using second differences. In the first example, Briggs considers two numbers and their logarithms and seeks to place nine equidistant numbers in between and to find their logarithms. Briggs first considers the case where the second differences are almost equal.

In general, if  $\Delta^1$ ,  $\Delta^2$ ,  $\Delta^3$ , etc., are the first, second, third, etc., differences of an equidistant series of terms, an interpolation between the term  $A$  and the next one is given by

$$z_x = A + x\Delta^1 + x \cdot \frac{x-1}{2}\Delta^2 + x \cdot \frac{x-1}{2} \cdot \frac{x-2}{3}\Delta^3 + \dots$$

This is Newton's forward difference formula, the differences  $\Delta^n$  being forward differences.<sup>15</sup>

If the second differences are constant, this expression reduces to  $z = A + x\Delta^1 + x \cdot \frac{x-1}{2}\Delta^2$ . We can take  $x = 0, \frac{1}{10}, \frac{2}{10}, \dots, 1$ , which gives:

$$\begin{aligned} z_{0.0} &= A \\ z_{0.1} &= A + \frac{1}{10}\Delta^1 - \frac{9}{200}\Delta^2 & z_{0.2} &= A + \frac{2}{10}\Delta^1 - \frac{16}{200}\Delta^2 \\ z_{0.3} &= A + \frac{3}{10}\Delta^1 - \frac{21}{200}\Delta^2 & z_{0.4} &= A + \frac{4}{10}\Delta^1 - \frac{24}{200}\Delta^2 \\ z_{0.5} &= A + \frac{5}{10}\Delta^1 - \frac{25}{200}\Delta^2 & z_{0.6} &= A + \frac{6}{10}\Delta^1 - \frac{24}{200}\Delta^2 \\ z_{0.7} &= A + \frac{7}{10}\Delta^1 - \frac{21}{200}\Delta^2 & z_{0.8} &= A + \frac{8}{10}\Delta^1 - \frac{16}{200}\Delta^2 \\ z_{0.9} &= A + \frac{9}{10}\Delta^1 - \frac{18}{200}\Delta^2 & z_{1.0} &= A + \frac{10}{10}\Delta^1 \end{aligned}$$

We have the following differences:

---

<sup>15</sup>Other interpolation formulæ use backward or central differences.

$$\begin{array}{ll}
z_{0.1} - z_{0.0} = \frac{1}{10}\Delta^1 - \frac{45}{1000}\Delta^2 & z_{0.2} - z_{0.1} = \frac{1}{10}\Delta^1 - \frac{35}{1000}\Delta^2 \\
z_{0.3} - z_{0.2} = \frac{1}{10}\Delta^1 - \frac{25}{1000}\Delta^2 & z_{0.4} - z_{0.3} = \frac{1}{10}\Delta^1 - \frac{15}{1000}\Delta^2 \\
z_{0.5} - z_{0.4} = \frac{1}{10}\Delta^1 - \frac{5}{1000}\Delta^2 & z_{0.6} - z_{0.5} = \frac{1}{10}\Delta^1 + \frac{5}{1000}\Delta^2 \\
z_{0.7} - z_{0.6} = \frac{1}{10}\Delta^1 + \frac{15}{1000}\Delta^2 & z_{0.8} - z_{0.7} = \frac{1}{10}\Delta^1 + \frac{25}{1000}\Delta^2 \\
z_{0.9} - z_{0.8} = \frac{1}{10}\Delta^1 + \frac{35}{1000}\Delta^2 & z_{1.0} - z_{0.9} = \frac{1}{10}\Delta^1 + \frac{45}{1000}\Delta^2
\end{array}$$

This is exactly Briggs' scheme, although he does not explain how he found it. His first example is the interpolation between  $\log 91235$  and  $\log 91236$ . The first and second differences are  $\Delta^1 = 0.00000476014799$  and  $\Delta^2 = -0.00000000005217$  [10, p. 24]. Writing in units of the 14th place,  $\Delta^1 = 476014799$  and  $\Delta^2 = -5217$ . Briggs obtains:

$$\begin{aligned}
\frac{1}{10}\Delta^1 &= 47601479.9 \\
z_{0.1} - z_{0.0} &= 47601479.9 + 234.765 = 47601714.7 \\
z_{0.2} - z_{0.1} &= 47601479.9 + 182.595 = 47601662.5 \\
z_{0.3} - z_{0.2} &= 47601479.9 + 130.425 = 47601610.3 \\
z_{0.4} - z_{0.3} &= 47601479.9 + 78.255 = 47601558.2 \\
z_{0.5} - z_{0.4} &= 47601479.9 + 26.085 = 47601506.0 \\
z_{0.6} - z_{0.5} &= 47601479.9 - 26.085 = 47601453.8 \\
z_{0.7} - z_{0.6} &= 47601479.9 - 78.255 = 47601401.6 \\
z_{0.8} - z_{0.7} &= 47601479.9 - 130.425 = 47601349.5 \\
z_{0.9} - z_{0.8} &= 47601479.9 - 182.595 = 47601297.3 \\
z_{1.0} - z_{0.9} &= 47601479.9 - 234.765 = 47601245.1
\end{aligned}$$

and from these differences, he obtains the values of  $z_x$  for the nine intermediate values.

Briggs also gives a shortcut to compute directly a value such as  $z_{0.7}$  [10, pp. 25–26]. This shortcut uses a table of the cumulated factors of  $\Delta^2$ . In this case,

$$z_{0.7} = z_{0.0} + 7\frac{1}{10}\Delta^1 - \frac{105}{1000}\Delta^2$$

Briggs gives another example where he seeks  $\sqrt{147}$  [10, pp. 26–27]. From the logarithm of 147, Briggs finds  $\log \sqrt{147} = 1.08365866737409$ . Using the table given in his chapter 11, Briggs finds the nearest complement  $\log 8192 = 0.91338994363175$ , the total of which is 0.99704861100584 (ignoring the integer part). He then finds two consecutive integers whose logarithms have a decimal expansion which is approaching:

$$\begin{aligned}
\log 99322 &\approx 4.99704545615255 \\
\log 99323 &\approx 4.99704982872152
\end{aligned}$$

By linear interpolation, Briggs finds that

$$\log 99322.7 < 4.99704861100584 < \log 99322.8$$

The interval obtained by linear interpolation will not always be correct, and presumably Briggs would have taken the next interval if the logarithm had lied outside of the presumed interval.

In any case, using the interpolation with second differences, Briggs then computes  $\log 99322.7$  and  $\log 99322.8$ . Finally, Briggs uses another linear interpolation to interpolate between  $\log 99322.7$  and  $\log 99322.8$  and he finds 99322.721509238, the correct value (if the decimal part 4.99...584 were correct) being 99322.721509228879... Dividing 99322.721509238 by 8192, Briggs finds 12.12435565298316, the correct value (if the decimal part 4.99...584 were correct) being 12.12435565298204 and the exact square root being 12.12435565298214. As a comparison, Briggs gives the true root as 12.124355652982141054.<sup>16</sup>

Briggs has used these methods to fill the blanks between 1 and 20000 and between 90001 and 100000.

### 3.6.3 Subtabulation by quinquisection

In the 13th chapter of the *Arithmetica logarithmica* [10, pp. 27–32], Briggs gives a new method which is suitable for the interval 20000–90000. Briggs does not explain how he obtained this method and we consider here a possible way of discovery.

Briggs had evidently been trying different approaches, using the differences in various ways. His idea here is to compute the values of the logarithms from 5 to 5 using previously computed logarithms. Then the values in between would be found by subtabulation. As a start, we consider the logarithms from 20000 to 20005, given here to 22 places together with their first differences:

$n$	$\log n$	$\Delta^1$
20000	4.3010299956639811952137	
		0.0000217141812451551372
20001	4.3010517098452263503509	
		0.0000217130956175145002
20002	4.3010734229408438648511	
		0.0000217120100984230585
20003	4.3010951349509422879096	
		0.0000217109246878645330
20004	4.3011168458756301524426	
		0.0000217098393858226471
20005	4.3011385557150159750897	

Since the logarithms only increase slowly, the first differences are approximately equal to  $\frac{\log 20005 - \log 20000}{5} = 0.00002171201020\dots$ . If only the values of  $\log(5n)$  are known, this approximation of the first differences can be used to find an approximation of  $\log 20001$ , but as it should be clear from the above values, the value of  $\log 20001$  will only be correct to about eight places. Briggs, instead, wanted to have 14 decimal places.

<sup>16</sup>There is actually a typographical error in the *Arithmetica logarithmica*, where the exact root is given as 12.124355652982441054 [10, p. 27].

In order to obtain a more accurate interpolation, Briggs applies a correction to the mean difference, as he did in chapter 12 using second differences. It is likely that Briggs started with a range of logarithms, for instance one that he had computed using the previous method. Here, we will consider that the values of  $\log n$  are known for  $n = 20000, 20001, \dots$ . Briggs could then put the first, second, third,  $\dots$ , differences in a table.

In order to simplify the exposition, we take the notations used by Legendre in 1815 [57].  $y, y', y'', \dots$ , are the values of the logarithm for 20000, 20001, 20002, etc. The various differences are  $\delta y, \delta y', \dots, \delta^2 y, \dots$

20000	$y = a$					
		$\delta y$				
20001	$y'$		$\delta^2 y$			
		$\delta y'$		$\delta^3 y$		
20002	$y''$		$\delta^2 y'$	$\delta^4 y$		
		$\delta y''$		$\delta^3 y'$	$\delta^5 y$	
20003	$y'''$		$\delta^2 y''$	$\delta^4 y'$		
		$\delta y'''$		$\delta^3 y''$	$\delta^5 y'$	
20004	$y^{IV}$		$\delta^2 y'''$	$\delta^4 y''$		
		$\delta y^{IV}$		$\delta^3 y'''$	$\delta^5 y''$	
20005	$y^V = a'$		$\delta^2 y^{IV}$	$\delta^4 y'''$		
		$\delta y^V$		$\delta^3 y^{IV}$	$\delta^5 y'''$	
20006	$y^{VI}$		$\delta^2 y^V$	$\delta^4 y^{IV}$		
			$\delta^3 y^V$			
.....						
20010	$y^X = a''$					

There are now basically two issues. First, given the values of  $a, a', a'', \dots$ , Briggs must have been looking for patterns to compute approximations of  $y', y'', y''', y^{IV}, \dots$ . Second, once Briggs had approximations of the  $\delta^i y^j$ , he had to compute  $y^j$  from them. These two problems are of course related, and Briggs must have tried to express  $\delta a = a' - a$  using the subtabulated differences. We can for instance write:

$$\begin{aligned}
 \delta a = a' - a &= \delta y + \delta y' + \delta y'' + \delta y''' + \delta y^{IV} \\
 &= (\delta y'' - \delta^2 y' - \delta^2 y) + (\delta y'' - \delta^2 y') + \delta y'' + (\delta y'' - \delta^2 y'') + (\delta y'' + \delta^2 y'' + \delta^2 y''') \\
 &= 5\delta y'' - 2\delta^2 y' - \delta^2 y + 2\delta^2 y'' + \delta^2 y''' \\
 &= 5\delta y'' - 2\delta^2 y' - (\delta^2 y' - \delta^3 y) + 2(\delta^2 y' + \delta^3 y') + (\delta^2 y'' + \delta^3 y'') \\
 &= 5\delta y'' - \delta^2 y' + \delta^3 y + 2\delta^3 y' + \delta^3 y'' + \delta^2 y'' \\
 &= 5\delta y'' - \delta^2 y' + (\delta^3 y' - \delta^4 y) + 2\delta^3 y' + \delta^3 y'' + \delta^2 y'' \\
 &= 5\delta y'' - \delta^2 y' + 3\delta^3 y' - \delta^4 y + \delta^3 y'' + \delta^2 y'' \\
 &= 5\delta y'' - \delta^2 y' + 3\delta^3 y' - (\delta^4 y' - \delta^5 y) + (\delta^3 y' + \delta^4 y') + \delta^2 y'' \\
 &= 5\delta y'' - \delta^2 y' + 4\delta^3 y' + \delta^5 y + \delta^2 y'' \\
 &= 5\delta y'' + (\delta^2 y'' - \delta^2 y') + 4\delta^3 y' + \delta^5 y \\
 &= 5\delta y'' + 5\delta^3 y' + \delta^5 y
 \end{aligned}$$

So, we have the simple expression

$$\frac{\delta a}{5} = \delta y'' + \delta^3 y' + \frac{\delta^5 y}{5} \tag{2}$$

There are of course much quicker ways to derive this equation [57, 40], but Briggs certainly found it after painstaking effort. The right-hand side of the equation uses differences which are positioned midway from  $a$  and  $a'$ . Briggs calls  $\frac{\delta a}{5}$  the mean first difference.

20000	$y = a$					
		$\delta y$				
20001	$y'$		$\delta^2 y$			
		$\delta y'$		$\delta^3 y$		
20002	$y''$		$\delta^2 y'$		$\delta^4 y$	
		<span style="border: 1px solid black; padding: 2px;"><math>\delta y''</math></span>		<span style="border: 1px solid black; padding: 2px;"><math>\delta^3 y'</math></span>		<span style="border: 1px solid black; padding: 2px;"><math>\delta^5 y</math></span>
20003	$y'''$		$\delta^2 y''$		$\delta^4 y'$	
		$\delta y'''$		$\delta^3 y''$		
20004	$y^{IV}$		$\delta^2 y'''$			
		$\delta y^{IV}$				
20005	$y^V = a'$					

Already before finding this formula, Briggs must have known that  $\delta y \approx \delta y' \approx \delta y'' \dots \approx \frac{\delta a}{5}$  but this equation shows that  $\frac{\delta a}{5}$  can be obtained from  $\delta y''$  using a small correction  $\delta^3 y' + \frac{\delta^5 y}{5}$ . In fact, looking at the first differences was probably enough for Briggs to notice that  $\frac{\delta a}{5}$  was closest to  $\delta y''$ . For instance, if  $a = \log 20000$ , we have, as seen above,

$$\begin{aligned} \frac{\delta a}{5} &= 0.0000217120102\dots \\ \delta y &= 0.0000217141812\dots \\ \delta y' &= 0.0000217130956\dots \\ \delta y'' &= 0.0000217120100\dots \\ \delta y''' &= 0.0000217109246\dots \end{aligned}$$

So  $\delta y''$  can also be obtained from  $\frac{\delta a}{5}$  using the correction  $-\delta^3 y' - \frac{1}{5}\delta^5 y$ .

After that, Briggs must have noticed that  $\delta^2 y \approx \delta^2 y' \approx \frac{\delta^2 a}{25}$ , and more exactly  $\frac{\delta^2 a}{25} \approx \delta^2 y^{IV}$ .

Probably after a long search, Briggs came up with

$$\frac{\delta^2 a}{25} = \delta^2 y^{IV} + 2\delta^4 y''' + \frac{7}{5}\delta^6 y'' + \frac{2}{5}\delta^8 y' + \frac{1}{25}\delta^{10} y \quad (3)$$

This formula also uses differences which are symmetrically located between  $a$  and  $a'$ . The next equation is

$$\frac{\delta^3 a}{125} = \delta^3 y^{VI} + 3\delta^5 y^V + \dots \quad (4)$$

and Briggs found a general way to obtain these formulæ without having to go through a long algebraic manipulation. The coefficients of these equations are given by Briggs in his *Arithmetica logarithmica* [10, p. 29].

In order to use these equations, we can see that the differences decrease quickly and become neglectible at some point. Neglecting all differences of order greater than 5 results in the following simplified equations:

$$\begin{aligned} \frac{\delta a}{5} &= \delta y'' + \delta^3 y' + \frac{\delta^5 y}{5} & \frac{\delta^2 a}{25} &= \delta^2 y^{IV} + 2\delta^4 y''' & \frac{\delta^3 a}{125} &= \delta^3 y^{VI} + 3\delta^5 y^V \\ \frac{\delta^4 a}{625} &= \delta^4 y^{VIII} & \frac{\delta^5 a}{5^5} &= \delta^5 y^X \end{aligned}$$

The last two equations give us a means to compute  $\delta^5 y$  (or  $\delta^5 y^v$ ,  $\delta^5 y^x$ , etc.) and  $\delta^4 y'''$  (or  $\delta^4 y^{viii}$ , etc.). Using the equation for  $\frac{\delta^3 a}{125}$ , we can compute  $\delta^3 y^{vi}$  (or  $\delta^3 y'$ ), and using the equation for  $\frac{\delta^2 a}{25}$ , we can compute  $\delta^2 y^{iv}$ . Finally, the first equation gives  $\delta y''$ .

The following table shows in boxes the values that have been approximated. The pattern of boxes is repeated every five values.

20000	$y = a$	$\delta y$				
20001	$y'$	$\delta y'$	$\delta^2 y$	$\delta^3 y$	$\delta^4 y$	$\delta^5 y$
20002	$y''$	$\delta y''$	$\delta^2 y'$	$\delta^3 y''$	$\delta^4 y'$	$\delta^5 y'$
20003	$y'''$	$\delta y'''$	$\delta^2 y''$	$\delta^3 y'''$	$\delta^4 y''$	$\delta^5 y''$
20004	$y^{iv}$	$\delta y^{iv}$	$\delta^2 y'''$	$\delta^3 y^{iv}$	$\delta^4 y'''$	$\delta^5 y'''$
20005	$y^v = a'$	$\delta y^v$	$\delta^2 y^{iv}$	$\delta^3 y^v$	$\delta^4 y^{iv}$	$\delta^5 y^{iv}$
20006	$y^{vi}$	$\delta y^{vi}$	$\delta^2 y^v$	$\delta^3 y^{vi}$	$\delta^4 y^v$	$\delta^5 y^v$
20007	$y^{vii}$	$\delta y^{vii}$	$\delta^2 y^{vi}$	$\delta^3 y^{vii}$	$\delta^4 y^{vi}$	$\delta^5 y^{vi}$
20008	$y^{viii}$	$\delta y^{viii}$	$\delta^2 y^{vii}$	$\delta^3 y^{viii}$	$\delta^4 y^{vii}$	$\delta^5 y^{vii}$
20009	$y^{ix}$	$\delta y^{ix}$	$\delta^2 y^{viii}$	$\delta^3 y^{ix}$	$\delta^4 y^{viii}$	$\delta^5 y^{viii}$
20010	$y^x = a''$	$\delta y^x$	$\delta^2 y^{ix}$	$\delta^3 y^{ix}$	$\delta^4 y^{viii}$	$\delta^5 y^{viii}$
.....						

All that now remains to do is to compute the other differences  $\delta y$ ,  $\delta y'$ ,  $\delta y''$ , and  $\delta y^{iv}$ . Assuming  $\delta^5 y = \delta^5 y' = \delta^5 y''$ , we compute  $\delta^4 y''$ ,  $\delta^4 y'$ , and  $\delta^4 y$ . All the other values follow, until the first differences, and finally the logarithms themselves:  $y' = a + \delta y$ ,  $y'' = y' + \delta y'$ , etc.

This method, Briggs' quinquisection, was reused in the *Trigonometria britannica* [11].

### 3.6.4 The method of quinquisection and Newton's interpolation

As could be expected, Briggs' method of quinquisection and Newton's forward difference formula agree. Briggs' quinquisection is actually a special case of Newton's formula seen from a different vantage point. In this section, we only give some hints for the comparison, but we do not give a complete proof.<sup>17</sup>

In order to compare the two methods, we can rewrite the method of quinquisection using only the differences involved in Newton's formula. We will only sketch the derivation, but the details can easily be filled. We have seen above that we have  $\delta y'' = \frac{\delta a}{5} - \delta^3 y' - \frac{\delta^5 y}{5}$ ,

<sup>17</sup>For details on Newton's work on interpolation and subtabulation by finite differences, see Whiteside [113], [114, pp. 672–681]. Newton was apparently unaware of Briggs' work on finite differences and subtabulation [111, pp. 13–14], [112, p. 234], [113, pp. 3–5].

but it is better to start with  $\delta y^{\text{xii}}$ , in order to avoid indices before  $a$ . By an easy transformation, we obtain

$$\delta y^{\text{xii}} = \frac{1}{5}\delta a'' - \frac{1}{5^3}\delta^3 a' + \frac{14}{5^6}\delta^5 a$$

Next, we consider the following equations:

$$\begin{aligned} \delta y^{\text{xi}} &= \delta y^{\text{xii}} - \delta^2 y^{\text{xi}} & \delta y^{\text{x}} &= \delta y^{\text{xi}} - \delta^2 y^{\text{x}} \\ \delta^2 y^{\text{x}} &= \delta^2 y^{\text{ix}} + \delta^3 y^{\text{ix}} & \delta^2 y^{\text{xi}} &= \delta^2 y^{\text{x}} + \delta^3 y^{\text{x}} \\ \delta^3 y^{\text{ix}} &= \delta^3 y^{\text{x}} - \delta^4 y^{\text{ix}} & \delta^3 y^{\text{x}} &= \delta^3 y^{\text{xi}} - \delta^4 y^{\text{x}} \\ \delta^4 y^{\text{ix}} &= \delta^4 y^{\text{viii}} + \delta^5 y^{\text{viii}} & \delta^4 y^{\text{x}} &= \delta^4 y^{\text{ix}} + \delta^5 y^{\text{ix}} \end{aligned}$$

We keep only the terms of order 4 or lower and obtain

$$\begin{aligned} \delta^4 y^{\text{ix}} &= \frac{1}{5^4}\delta^4 a + \dots & \delta^2 y^{\text{x}} &= \frac{1}{5^2}\delta^2 a' + \frac{1}{5^3}\delta^3 a' - \frac{4}{5^4}\delta^4 a + \dots \\ \delta^4 y^{\text{x}} &= \frac{1}{5^4}\delta^4 a + \dots & \delta^2 y^{\text{xi}} &= \frac{1}{5^2}\delta^2 a' + \frac{2}{5^3}\delta^3 a' - \frac{1}{5^3}\delta^4 a + \dots \\ \delta^3 y^{\text{x}} &= \frac{1}{5^3}\delta^3 a' - \frac{1}{5^4}\delta^4 a + \dots & \delta y^{\text{xi}} &= \frac{1}{5}\delta a'' - \frac{1}{5^2}\delta^2 a' - \frac{3}{5^3}\delta^3 a' + \frac{1}{5^3}\delta^4 a + \dots \\ \delta^3 y^{\text{ix}} &= \frac{1}{5^3}\delta^3 a' - \frac{2}{5^4}\delta^4 a + \dots & \delta y^{\text{x}} &= \frac{1}{5}\delta a'' - \frac{2}{5^2}\delta^2 a' - \frac{4}{5^3}\delta^3 a' + \frac{9}{5^4}\delta^4 a + \dots \end{aligned}$$

We then introduce  $\delta^2 a''$  using  $\delta^2 a' = \delta^2 a'' - \delta^3 a'$  and make similar other replacements, leading to

$$\delta y^{\text{x}} = \frac{1}{5}\delta a'' - \frac{2}{5^2}\delta^2 a'' + \frac{6}{5^3}\delta^3 a'' - \frac{21}{5^4}\delta^4 a'' + \dots$$

This formula contains explicitly all terms of orders up to the fourth. We can compare these first four terms with those of Newton's forward difference formula. We have

$$\delta y^{\text{x}} = \frac{1}{5}\delta a'' + \frac{1}{5} \cdot \frac{\frac{1}{5} - 1}{2}\delta^2 a'' + \frac{1}{5} \cdot \frac{\frac{1}{5} - 1}{2} \cdot \frac{\frac{1}{5} - 2}{3}\delta^3 a'' + \frac{1}{5} \cdot \frac{\frac{1}{5} - 1}{2} \cdot \frac{\frac{1}{5} - 2}{3} \cdot \frac{\frac{1}{5} - 3}{4}\delta^4 a'' + \dots$$

The first value obtained by quinquisection therefore agrees to our level of accuracy with the value that would have been obtained by Newton's interpolation formula. The same applies to  $\delta y^{\text{xi}}$ ,  $\delta y^{\text{xii}}$ , etc.

### 3.6.5 Link with Bürgi's interpolation

Together with the publication of Jost Bürgi's "Coss," List and Bialas have suggested that Bürgi may have used for the computation of his *Canon sinuum* an interpolation scheme identical or similar to Briggs' quinquisection [58, pp. 76–77, 100, 116–123]. Briggs had also used his quinquisection when he computed sines in the *Trigonometria britannica*. Bürgi, however, kept the details of his interpolation scheme somewhat secret, and we know little more than that it was based on differences. It would be preposterous to suggest that Briggs was inspired by Bürgi, perhaps through Ursus, as we have shown that Briggs could very well arrive to his scheme independently.

Although Bürgi considers interpolating one-degree intervals by steps of  $2''$  or  $4''$  [58, pp. 76–77], that is dividing in 1800 or 900 smaller intervals, Oechslin suggested an interpretation of Bürgi’s description in the case of quinquisection [75, pp. 81–92]. Considering again the following table

$y = a$					
$y'$	$\delta y$				
$y''$	$\delta y'$	$\delta^2 y$			
$y'''$	$\delta y''$	$\delta^2 y'$	$\delta^3 y$		
$y^{IV}$	$\delta y'''$	$\delta^2 y''$	$\delta^3 y'$	$\delta^4 y$	
$y^V = a'$	$\delta y^{IV}$	$\delta^2 y'''$	$\delta^3 y''$	$\delta^4 y'$	$\delta^5 y$
$y^{VI}$	$\delta y^V$	$\delta^2 y^{IV}$	$\delta^3 y'''$	$\delta^4 y''$	$\delta^5 y'$
		$\delta^2 y^V$	$\delta^3 y^{IV}$	$\delta^4 y'''$	$\delta^5 y''$
			$\delta^3 y^V$	$\delta^4 y^{IV}$	$\delta^5 y'''$
.....					
$y^x = a''$					

we can transform it into

$y = a$					
$y'$	$5\delta y$				
$y''$	$5\delta y'$	$5^2\delta^2 y$			
$y'''$	$5\delta y''$	$5^2\delta^2 y'$	$5^3\delta^3 y$		
$y^{IV}$	$5\delta y'''$	$5^2\delta^2 y''$	$5^3\delta^3 y'$	$5^4\delta^4 y$	
$y^V = a'$	$5\delta y^{IV}$	$5^2\delta^2 y'''$	$5^3\delta^3 y''$	$5^4\delta^4 y'$	$5^5\delta^5 y$
$y^{VI}$	$5\delta y^V$	$5^2\delta^2 y^{IV}$	$5^3\delta^3 y'''$	$5^4\delta^4 y''$	$5^5\delta^5 y'$
		$5^2\delta^2 y^V$	$5^3\delta^3 y^{IV}$	$5^4\delta^4 y'''$	$5^5\delta^5 y''$
			$5^3\delta^3 y^V$	$5^4\delta^4 y^{IV}$	$5^5\delta^5 y'''$
.....					
$y^x = a''$					

Oechslin (who does not mention Briggs) wants to interpolate between  $a$  and  $a'$ . So, he will compute five values for the first differences, between  $a$  and  $a'$ . The third of these five values is  $\delta a$ . All these values will be divided by 5 and then added to one another to produce  $y'$ ,  $y''$ , etc. Oechslin’s five values are therefore approximations of  $5\delta y$ ,  $5\delta y'$ , etc. But in order to obtain these approximations, Oechslin needs approximations of their differences, that is approximations of  $5\delta^2 y$ ,  $5\delta^2 y'$ , etc. He in fact obtains approximations of  $5^2\delta^2 y$ ,  $5^2\delta^2 y'$ , etc., which he then divides by 5. Eventually, and to start with, Oechslin needs approximations of the last differences, which are here  $5^5\delta^5 y$ ,  $5^5\delta^5 y'$ , etc. But, as shown above, an approximation of  $5^5\delta^5 y$ ,  $5^5\delta^5 y'$ , etc., is  $\delta^5 a$ . An approximation of  $5^4\delta^4 y$ ,

$5^4\delta^4y'$ , etc., is  $\delta^4a$ . An approximation of  $5^3\delta^3y$ ,  $5^3\delta^3y'$ , etc., is  $\delta^3a$ . An approximation of  $5^2\delta^2y$ ,  $5^2\delta^2y'$ , etc., is  $\delta^2a$ . And an approximation of  $5\delta y$ ,  $5\delta y'$ , etc., is  $\delta a$ .

In order to increase the accuracy, we can take

$$\begin{aligned} 5^5\delta^5y^x &\approx \delta^5a \\ 5^4\delta^4y^{\text{viii}} &\approx \delta^4a \\ 5^3\delta^3y^{\text{vi}} &\approx \delta^3a \\ 5^2\delta^2y^{\text{iv}} &\approx \delta^2a \\ 5\delta y'' &\approx \delta a \end{aligned}$$

and then write

$$\begin{aligned} 5^4\delta^4y' &\approx 5^4\delta^4y + \frac{\delta^5a}{5} \\ 5^4\delta^4y'' &\approx 5^4\delta^4y' + \frac{\delta^5a}{5} \\ &\dots\dots \\ 5^3\delta^3y' &\approx 5^3\delta^3y + \frac{5^4\delta^4y}{5} \\ 5^3\delta^3y'' &\approx 5^3\delta^3y' + \frac{5^4\delta^4y'}{5} \\ &\dots\dots \end{aligned}$$

If we apply this interpolation to a table of sines for each degree between  $0^\circ$  and  $10^\circ$ , with five differences and 10 decimal places, we obtain the intermediate values with only five or six exact places. If instead we apply the interpolation to a table of sines for all minutes from  $0'$  to  $10'$ , we obtain eight to nine exact decimal places.

Oechslin's scheme is actually not as accurate as Briggs', although they may look similar. In order to compare the two schemes, let us take a simpler case with only three differences. Such an example is given by Oechslin [75, pp. 83].

$$\begin{array}{rcccc} y & = & a & & \\ y' & & & & \delta^3a \\ y'' & & & & \delta^3a \\ & \delta a & & & \delta^3a \\ y''' & & \alpha_4 & & \delta^3a \\ y^{\text{iv}} & & \alpha_5 & & \delta^3a \\ y^{\text{v}} = a' & & \delta^2a & & \delta^3a \\ & \alpha_1 & \alpha_6 & & \delta^3a \\ y^{\text{vi}} & & \alpha_2 & & \delta^3a \\ & \alpha_2 & \alpha_7 & & \delta^3a \\ y^{\text{vii}} & & \delta a' & & \delta^3a \\ & \delta a' & \alpha_8 & & \delta^3a \\ y^{\text{viii}} & & \alpha_3 & & \delta^3a \\ & \alpha_3 & & & \delta^3a \\ y^{\text{ix}} & & & & \delta^3a \\ y^{\text{x}} = a'' & & & & \delta^3a \end{array}$$

In Oechslin's example,  $\delta^3 a$  is constant. Consider now the values of  $y^{\text{vi}}$ ,  $y^{\text{vii}}$ ,  $y^{\text{viii}}$ , and  $y^{\text{ix}}$ . We have

$$\begin{aligned}
\alpha_1 &= \delta a + \frac{\alpha_4 + \alpha_5 + \delta^2 a}{5} & \alpha_2 &= \delta a + \frac{\alpha_4 + \alpha_5 + \delta^2 a + \alpha_6}{5} \\
\alpha_3 &= \delta a' + \frac{\alpha_8}{5} & \alpha_4 &= \delta^2 a - 2\frac{\delta^3 a}{5} \\
\alpha_5 &= \delta^2 a - \frac{\delta^3 a}{5} & \alpha_6 &= \delta^2 a + \frac{\delta^3 a}{5} \\
\alpha_7 &= \delta^2 a + 2\frac{\delta^3 a}{5} & \alpha_8 &= \delta^2 a + 3\frac{\delta^3 a}{5} \\
y^{\text{vi}} &= y^{\text{v}} + \frac{\alpha_1}{5} & y^{\text{vii}} &= y^{\text{vi}} + \frac{\alpha_2}{5} \\
y^{\text{viii}} &= y^{\text{vii}} + \frac{\delta a'}{5} & y^{\text{ix}} &= y^{\text{viii}} + \frac{\alpha_3}{5}
\end{aligned}$$

therefore

$$\begin{aligned}
y^{\text{vi}} &= a' + \frac{\delta a}{5} + \frac{3}{25}\delta^2 a - \frac{3}{125}\delta^3 a \\
y^{\text{vii}} &= a' + 2\frac{\delta a}{5} + \frac{7}{25}\delta^2 a - \frac{5}{125}\delta^3 a \\
y^{\text{viii}} &= a' + 2\frac{\delta a}{5} + \frac{\delta a'}{5} + \frac{7}{25}\delta^2 a - \frac{5}{125}\delta^3 a \\
y^{\text{ix}} &= a' + 2\frac{\delta a}{5} + 2\frac{\delta a'}{5} + \frac{8}{25}\delta^2 a - \frac{2}{125}\delta^3 a \\
(y^{\text{x}}) &= a' + 2\frac{\delta a}{5} + 3\frac{\delta a'}{5} + \frac{11}{25}\delta^2 a - \frac{5}{125}\delta^3 a
\end{aligned}$$

The last value is the one that we would obtain by a further step, but normally we use the value  $a''$ .

We can compare these equations with those obtained by Briggs in the same conditions. Assuming  $\delta^4 a = 0$ , we find

$$\begin{aligned}
\frac{\delta a}{5} &= \delta y'' + \delta^3 y' \\
\frac{\delta^2 a}{25} &= \delta^2 y^{\text{iv}} \\
\frac{\delta^3 a}{125} &= \delta^3 y^{\text{vi}}
\end{aligned}$$

and

$$\delta^2 y''' = \delta^2 y^{IV} - \delta^3 y$$

$$\delta^2 y'' = \delta^2 y''' - \delta^3 y$$

$$\begin{aligned} \delta y^V &= \delta y'' + \delta^2 y'' + \delta^2 y''' + \delta^2 y^{IV} = \frac{\delta a}{5} - \delta^3 y + (\delta^2 y''' - \delta^3 y) + (\delta^2 y^{IV} - \delta^3 y) + \delta^2 y^{IV} \\ &= \frac{\delta a}{5} - 3\delta^3 y + 2\delta^2 y^{IV} + \delta^2 y''' = \frac{\delta a}{5} - 4\delta^3 y + 3\delta^2 y^{IV} \end{aligned}$$

$$y^{VI} = a' + \delta y^V = a' + \frac{\delta a}{5} + 3\delta^2 y^{IV} - 4\delta^3 y$$

$$= a' + \frac{\delta a}{5} + \frac{3}{25}\delta^2 a - \frac{4}{125}\delta^3 a$$

$$y^{VII} = a' + 2\frac{\delta a}{5} + \frac{7}{25}\delta^2 a - \frac{7}{125}\delta^3 a$$

$$y^{VIII} = a' + 2\frac{\delta a}{5} + \frac{\delta a'}{5} + \frac{7}{25}\delta^2 a - \frac{8}{125}\delta^3 a$$

$$y^X = a' + 2\frac{\delta a}{5} + 2\frac{\delta a'}{5} + \frac{8}{25}\delta^2 a - \frac{6}{125}\delta^3 a$$

$$(y^X) = a' + 2\frac{\delta a}{5} + 3\frac{\delta a'}{5} + \frac{10}{25}\delta^2 a$$

Oechslin's formulæ slightly differ from these ones. In this case, Briggs' formulæ give the exact values, and Oechslin's scheme is therefore only an approximation. For instance, if we apply Briggs' scheme to Oechslin's example where he interpolates a function such that  $a = 10$ ,  $a' = 20$ ,  $a'' = 40$ ,  $\delta a = 10$ ,  $\delta a' = 20$ ,  $\delta^2 a = 10$ ,  $\delta^3 a = 5$ , the formulæ above give exactly Oechslin's values, and in particular the interpolated value of  $y^X$  is 40.2 [75, pp. 83]. But Briggs' scheme gives the correct value 40.

Oechslin's interpretation applied to larger intervals is not more satisfactorily, and it seems doubtful that this was Bürgi's scheme, as Bürgi would certainly have noticed a difference between his tables and previous sine tables.

In fact, Bürgi's description does not seem to allude to quinquisection, and we may have to look for another idea, as was suggested in our study of Bürgi's progression tables [88].

### 3.7 The radix method

In Chapter 14 of the *Arithmetica logarithmica* [10, pp. 33–36], Briggs gives the so-called radix method, for finding the logarithm of a number.<sup>18</sup> This method involves the use of radices, or numbers of the form  $1 + \frac{r}{10^n}$ , together with their logarithms. There are several variants of this method. A number  $N$  is for instance decomposed in a product  $N_0(1 + q_1)(1 + q_2) \dots$ , where  $\log N_0$  is known and the  $q_i$  are fractions  $r \cdot 10^{-n}$  found in an iterative way. The value of  $\log N$  is then obtained by a mere addition using the radix table. Historical descriptions of the writings on the radix method were published by Ellis [23, 24] and Lupton [59, 60] and further analyses are given by Glaisher [38].

In his first example, Briggs considers the number  $x = 3.66067578833852$  and shows how to compute the number of which it is the logarithm, that is its antilogarithm. From

<sup>18</sup>Given that Vlacq omitted Briggs' chapters 12 and 13, the radix method appears in Chapter 12 of Vlacq's *Arithmetica logarithmica* [104].

$x$ , Briggs subtracts 3, then  $\log 3 = 0.477121254719662$ ,  $\log 1.4 = 0.146128035678238$ , and  $\log 1.09 = 0.037426497940624$  and finds nearly 0, so that  $x \approx 3 + \log 3 + \log 1.4 + \log 1.09$ . All these logarithms are found in the radix table given by Briggs [10, p. 32]. It should be noted that Briggs did not subtract  $\log 1.5$ , although  $x - 3 - \log 3 > \log 1.5$ , so that this method can obviously be applied in different ways. In any case, Briggs concludes that  $x = \log(10^3 \cdot 3 \cdot 1.4 \cdot 1.09) = \log 4578$ . In a second example, Briggs suggests to first take the nearest smaller logarithm in the main table (1–20000, 90001–100000), to subtract it from the given number  $x$  and to continue with the radix table.

The same radix table can be used to find the logarithm of any number. Briggs considers the problem of finding the logarithm of  $x = 3041.851528656$ . In order to express Briggs's method, we first define  $\nu(x)$  to be the truncation of  $x$  to one significant digit.<sup>19</sup> For instance,  $\nu(0.0002800160\dots) = 0.0002$ . The method then consists in first dividing this number by  $x_0 = 3041$ , whose logarithm lies in the main table.<sup>20</sup> Then the following sequence is constructed:  $r_1 = x - x_0 = 0.851528656$ ,  $q_1 = \nu\left(\frac{r_1}{x-r_1}\right)$ ,  $r_2 = x - x_0(1 + q_1)$ ,  $q_2 = \nu\left(\frac{r_2}{x-r_2}\right)$ ,  $r_3 = x - x_0(1 + q_1)(1 + q_2)$ ,  $q_3 = \nu\left(\frac{r_3}{x-r_3}\right)$ ,  $r_4 = x - x_0(1 + q_1)(1 + q_2)(1 + q_3)$ ,  $q_4 = \nu\left(\frac{r_4}{x-r_4}\right)$ ,  $r_5 = x - x_0(1 + q_1)(1 + q_2)(1 + q_3)(1 + q_4)$ ,  $\dots$

With this procedure,  $x$  is approximated by  $x_0(1 + q_1)(1 + q_2)(1 + q_3)(1 + q_4)$  and therefore  $\log x = \log x_0 + \log(1 + q_1) + \log(1 + q_2) + \dots$ , all of these logarithms being known. In the case of the above example, Briggs found  $3041.851528656 = 3041 \cdot 1.0002 \cdot 1.00008 \dots$  and therefore  $\log 3041.851528656 = \log 3041 + \log 1.0002 + \log 1.00008 + \dots$ . In fact, since Briggs chose  $3041.851528656 = 3041 \cdot 1.0002 \cdot 1.00008$ , we have exactly  $\log 3041.851528656 = \log 3041 + \log 1.0002 + \log 1.00008$ . Briggs gives a second example following the same principle, with  $x = 2966.82051456$  and finds  $q_1 = 0.0002$ ,  $q_2 = 0.00007$ ,  $q_3 = 0.000006$ , etc., and eventually  $\log 2966.82051456 = 3.472291273349534$ , the correct value being  $3.472291273349533 \dots$

The radix method is fairly straightforward for a manual application, the most difficult part being the computation of the ratios  $\frac{r_i}{x-r_i}$ . In the *Arithmetica logarithmica*, Briggs organized the computations in such a way that one presumes they could be taught easily using standard forms.

According to Glaisher [38], this method was first applied in 1618 in an anonymous appendix to the second edition of Wright's translation of Napier's *Descriptio* [69]. By an analysis of the notations, Glaisher has concluded that the author was in fact William Oughtred.

## 4 The computers

Briggs was aided by other computers for which he prepared forms that they could fill [96, p. 51]. We do unfortunately not know the names of those who assisted Briggs, except in a few instances. Edmund Gunter, who published the first decimal logarithms of trigonometric functions [41], may have been one of them [36, p. 381]. There also remains a letter from J. Wells to Briggs, dated January 9, 1621, from which it appears that Wells assisted

<sup>19</sup>We could express  $\nu(x)$  formally as  $\nu(x) = E\left(\frac{x}{10^{E(\log x)}}\right) \times 10^{E(\log x)}$  where  $E(x)$  is the greatest integer smaller than  $x$ .

<sup>20</sup>If Briggs' main table had been complete, he would certainly have divided  $x$  by 30418.

Briggs in the computations of the logarithms [80, vol. 1, pp. 5–6], [36, p. 381]. Wells was the later author of a *Sciographia* in 1635 [107].

There is also Euclid Speidell’s testimony [98] (cited by Egen [21, p. 257]), according to which Briggs was assisted by eight computers for one year. This does not totally fit with the time elapsed between publications, but it gives nevertheless a general idea of how the calculations were performed.

## 5 Vlacq’s table and Briggs’ projects

In 1628, Adriaan Vlacq published a table giving the logarithms of the numbers from 1 to 100000 with only 10 places, which he called a second edition of Briggs’ table, although it actually wasn’t [104].

Glaisher [36, pp. 380–381] cites an excerpt from a letter dated October 25th, 1628 from Briggs to Pell in which Briggs mentions his projects and how they were altered by Vlacq:<sup>21</sup>

*My desire was to have those Chiliades that are wantinge betwixt 20 and 90 calculated and printed, and I had done them all almost by my selfe, and by some frendes whom my rules had sufficiently informed, and by agreement the business was conveniently parted amongst us; but I am eased of that charge and care by one Adrian Vlacque, an Hollander, who hathe done all the whole hundred chiliades and printed them in Latin, Dutche, and Frenche, 1000 bookes in these 3 languages, and hathe sould them almost all. But he hathe cutt of 4 of my figures throughout; and hathe left out my Dedication, and to the reader, and two chapters the 12 and 13, in the rest he hathe not varied from me at all.*

It is likely that Briggs had planned to fill the missing interval with 14 places, and even that this project had reached an advanced stage, but that Vlacq’s publication cut his project short [4, p. 220]. According to Glaisher, there is no doubt that Briggs’ friends were annoyed at Vlacq’s publication of 1628 [35, p. 301]. And indeed, in 1631, Richard Norwood wrote, referring to Miller’s 1631 edition of Vlacq’s tables:

*And here I have just occasion to blame the ill dealings of these men, not only towards my selfe, as I have before noted in the Preface to the Reader, but likewise towards Mr. Briggs, both in the matter before mentioned, and in printing a second edition of his Arithmetica Logarithmica in Latine, whilest he lived, against his minde and liking: and brought them over to sell, when the first were unsolde; so frustrating those additions which Mr. Briggs intended in his second Edition, and moreover leaving out some things, that were in the first edition, of special moment. A practice of very ill consequence, and tending to the great discouragement of such as take paines in this kind.<sup>22</sup>*

---

<sup>21</sup>The full letter is reproduced in Halliwell’s *Rara mathematica* [44, pp. 55–57].

<sup>22</sup>[74], cited in [67, p. 172]

According to Hallowes, Briggs must then have felt that he could not complete both the tables of the logarithms of numbers and the logarithms of trigonometric functions, that the completion of the *Arithmetica logarithmica* had been reduced to a certain routine, and he must then have turned to the trigonometric functions exclusively [45, p. 85].

## 6 Briggs' and Vlacq's legacy

Briggs' table served as a basis for Vlacq's own *Arithmetica logarithmica*, and therefore is the foundation of almost all later extensive tables of logarithms until the 20th century.

For 300 years, Briggs' scheme lay uncompleted. There have been several undertakings, but none that would carry out completely Briggs' scheme was ever printed before 1952. The most famous of them, the *Tables du cadastre*, only guaranteed 12 places<sup>23</sup> and did not go beyond Briggs' 14 places [35, p. 301]. Edward Sang's tables were most extensive, but were never printed [18].

Edward Sang was one of the few to be critical towards the usefulness of the *Tables du cadastre* for checking the tables of Briggs or Vlacq [91]. Obviously, if 12 decimal places are exact (in the above sense) in the *Tables du cadastre*, this means that the error on the unrounded logarithm is less than  $5 \cdot 10^{-13}$ . The 13th and 14th decimals are therefore uncertain and the values of the *Tables du cadastre* cannot be used reliably (except in certain cases) to check these decimals in other tables with certainty.

Eventually, in 1924, the tercentenary of Briggs' table was celebrated by starting the publication of Thompson's *Logarithmetica Britannica* [100], which was completed in 1952 [101]. Thompson's table gave the logarithms of all integers up to 100000 with 20 decimal places.

## 7 The tables' errors

Briggs' table contains a number of errors and an errata is given at the beginning of the *Arithmetica logarithmica*. A supplementary errata was given by Lefort in 1858 [55, p. 147]. A comparison of Briggs' table with Prony's *Tables du cadastre* was made around 1800 by Letellier and Guyetant, two employees of the French cadastre, and their result was added at the end of Briggs' somewhat incomplete volume at the *Bibliothèque Sainte-Geneviève* in Paris.<sup>24</sup> They compared the 13th and 14th decimals of Briggs' table with those of the *Tables du cadastre*, and since the *Tables du cadastre* are only guaranteed to give 12 exact decimals,<sup>25</sup> only large errors in Briggs' table could be found this way. The errata which was therefore gathered was restricted to errors occurring before the 12th decimal for  $n > 10000$ . For  $n < 10000$ , the *Tables du cadastre* contain more accurate values of the logarithms and the errata sometimes gives errors beyond the 11th decimal.

---

<sup>23</sup>Here and in the sequel, it should be understood that we mean that the error is smaller than  $5 \cdot 10^{-13}$ , which in fact does not guarantee the first 12 decimal places.

<sup>24</sup>Bibliothèque Sainte-Geneviève, FOL V 64(2) INV 84 RES. Prony has apparently added the same errata to his own copy of the *Arithmetica Logarithmica* [56, p. 996], which he bought in Montpellier. (minutes of the *Bureau des longitudes*, 8 frimaire 11, where Prony announced his errata [28])

<sup>25</sup>More exactly, the error on the 12th decimal of the unrounded logarithm is smaller than half a unit of the 13th place.

The comparison could have been done systematically until the 14th place in this interval, but it was apparently not done.<sup>26</sup> In any case, it is known that there are a large number of small errors in Briggs' table.<sup>27</sup>

A more comprehensive errata was given in 1952 by Thompson in his *Logarithmetica Britannica* [101, pp. LXXVIII–LXXXIII]. An overview of the erratas is given by Fletcher *et al.* [30, p. 794]. Thompson found almost 1200 errors, ignoring errors of one unit in the fourteenth decimal, and the number of errors affecting the first twelve decimals appears to be over 180.

## 8 Structure of the tables and recomputation

The original *Arithmetica logarithmica* contains an introduction of 88 pages, immediately followed by the first page of the tables, giving the logarithms of all integers from 1 to 20000 and from 90001 to 100000 to 14 decimal places. These tables were recomputed using the GNU `mpfr` multiple-precision floating-point library developed at INRIA [31], and give the exact values. The comparison of our table and Briggs' will therefore immediately show where Briggs' table contains errors, and this is of course one of the purposes of this reconstruction. Apart from the change in accuracy, we have tried to be as faithful as possible to the original tables. We have however added some values in a few cases where Briggs had left blanks. The original tables had for instance a blank space for the difference between  $\log 2$  and  $\log 1$  and we have put the correct value.

In addition to the reconstruction of Briggs' *Arithmetica logarithmica*, we have also reconstructed the “ideal” *Arithmetica logarithmica*, that is, a table giving the logarithms for the whole range from 1 to 100000, as Briggs had wanted it. This reconstruction is given in a separate document [87].

## 9 Acknowledgements

It is a pleasure to thank Ian Bruce who, by providing translations of key parts of Briggs' *Arithmetica logarithmica* and *Trigonometria britannica*, made the present analysis much easier.

---

<sup>26</sup>The logarithms below 10000 in the *Tables du cadastre* do not contain added figures for comparison, which seems to hint to the fact that no comparison was made. Moreover Lefort also seems to regret this omission [55, p. 147]. On the other hand, as shown in our study of the *Tables du cadastre* [90], these logarithms were computed to 19 decimals, but their accuracy was not 19 decimals. It should also be noted that as a consequence of this comparison and of the trust Prony had in his tables, he mistakenly attributed some errors to Briggs, when the errors were in fact in Prony's tables [90].

<sup>27</sup>In 1910, before the publication of his own tables, Henri Andoyer wrote that the last place of Briggs' tables was usually wrong by several units [3].

## References

The following list covers the most important references<sup>28</sup> related to Briggs' tables. Not all items of this list are mentioned in the text, and the sources which have not been seen are marked so. We have added notes about the contents of the articles in certain cases.

<sup>28</sup>**Note on the titles of the works:** Original titles come with many idiosyncrasies and features (line splitting, size, fonts, etc.) which can often not be reproduced in a list of references. It has therefore seemed pointless to capitalize works according to conventions which not only have no relation with the original work, but also do not restore the title entirely. In the following list of references, most title words (except in German) will therefore be left uncapitalized. The names of the authors have also been homogenized and initials expanded, as much as possible.

The reader should keep in mind that this list is not meant as a facsimile of the original works. The original style information could no doubt have been added as a note, but we have not done it here.
