HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers. L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

$$X_{i}^{n+1} = \frac{1}{Z_{i}} \sum_{j \in V_{i}} X_{j}^{n} w_{i,j}^{n}$$

Weights:

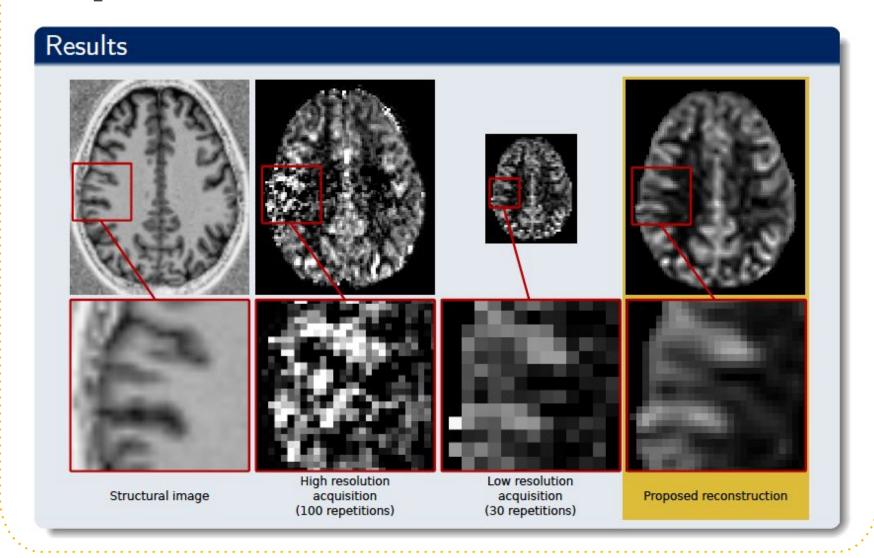

$$w_{i,j}^{n} = \exp -\left(\frac{||N(X_{i,S}) - N(X_{j,S})||_{2}^{2}}{\beta_{struct}\sigma_{i,S}^{2}} + \frac{||N(X_{i}^{n}) - N(X_{j}^{n})||_{2}^{2}}{\beta_{asl}\sigma_{i}^{2}}\right)$$

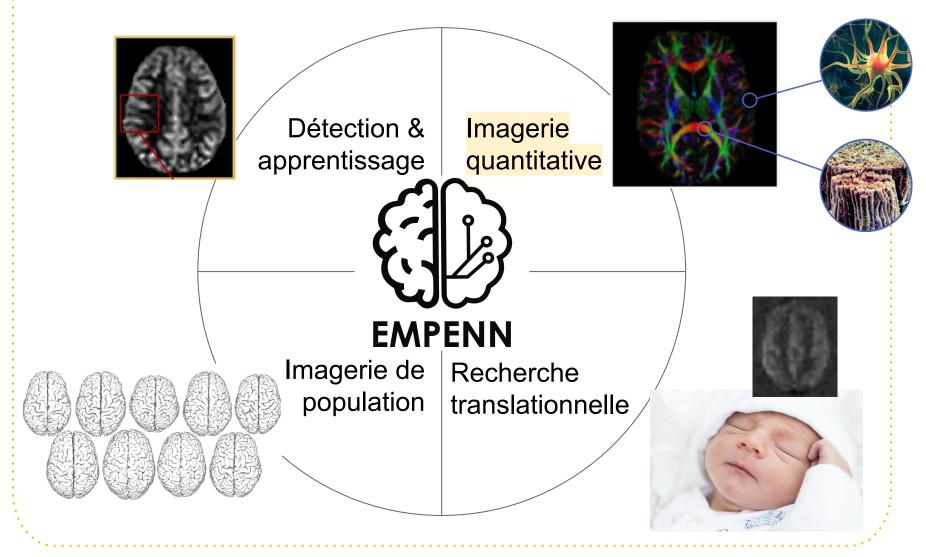

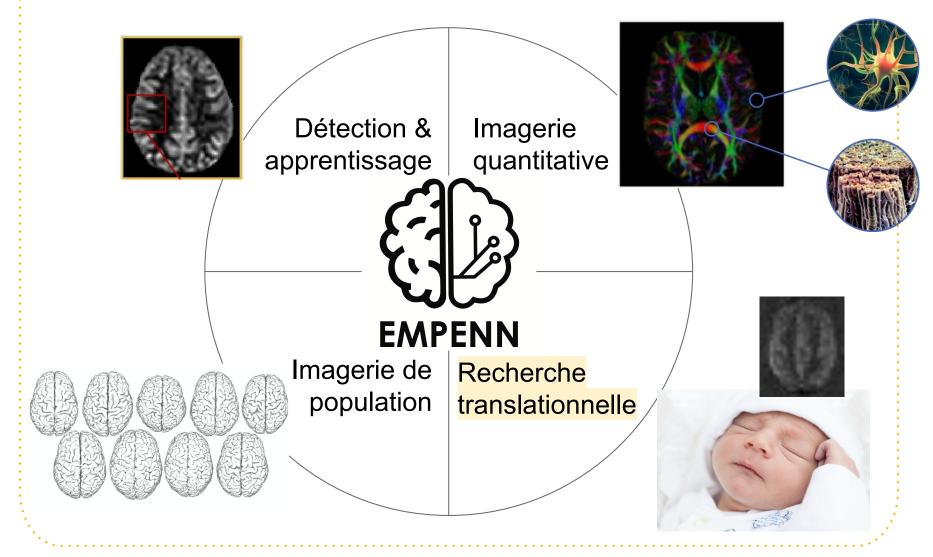

Investigation: $\beta_{asl} = \beta_{struct} = 0.5$

VIE EN LIGNE

Une étude démontre les biais de la reconnaissance faciale, plus efficace sur les hommes blancs

Lorsqu'il s'agit de reconnaître le genre d'un homme blanc, des logiciels affichent un taux de réussite de 99 %. La tâche se complique lorsque la peau d'une personne est plus foncée, ou s'il s'agit d'une femme.

Why are middle-aged marathon runners faster than twentysomethings?

According to new data from the running app Strava, runners in their 40s are streets ahead of younger rivals

▲ 'Middle-aged ruppers outperform ruppers in the 20s. ' Photograph- FatCamera/Gett

ccording to data released by the running app Strava, middle-aged runners consistently average faster marathon times than their younger rivals, apparently defying the usual rules of athletic performance. Men in the 40-49 age bracket clock an average time of four hours and 17 minutes for a marathon, according to the recent figures. Women in the same age range typically come in at just under the five-hour mark.

Les marathoniens de 40 ans plus rapides que vingtenaires ???

A Waste of 1,000 Research Papers

Decades of early research on the genetics of depression were built on nonexistent foundations. How did that happen?

ED YONG MAY 17, 2019

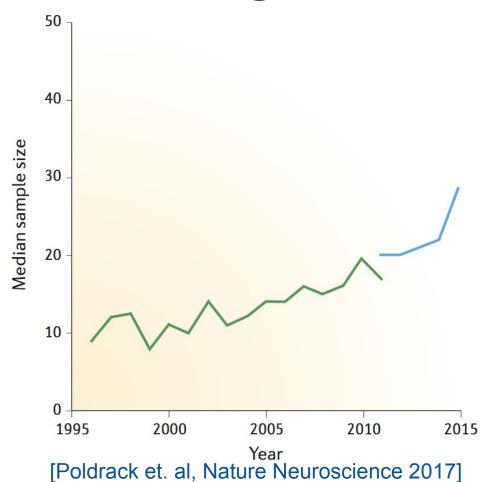

SEAN NEL / SHUTTERSTOCK

In 1996, <u>a group of European researchers</u> found that a certain gene, called *SLC6A4*, might influence a person's risk of depression.

It was a blockbuster discovery at the time. The team found that <u>a less active</u> <u>version</u> of the gene was more common among 454 people who had mood disorders than in 570 who did not. In theory, anyone who had this particular gene variant could be at higher risk for depression, and that finding, they said, might help in diagnosing such disorders, assessing suicidal behavior, or even predicting a person's response to antidepressants.
